ASSESSING HEALTH WORKERS' PERFORMANCE

A Manual for Training and Supervision

F. M. KATZ & R. SNOW

THE studies published in the Public Health Papers series draw attention to modern trends and changing concepts in public health and are intended primarily to stimulate discussion and encourage planning. Some reflect purely personal opinions, others are of the symposium type, yet others are surveys of existing knowledge or practical approaches to tasks facing the public health or medical profession.

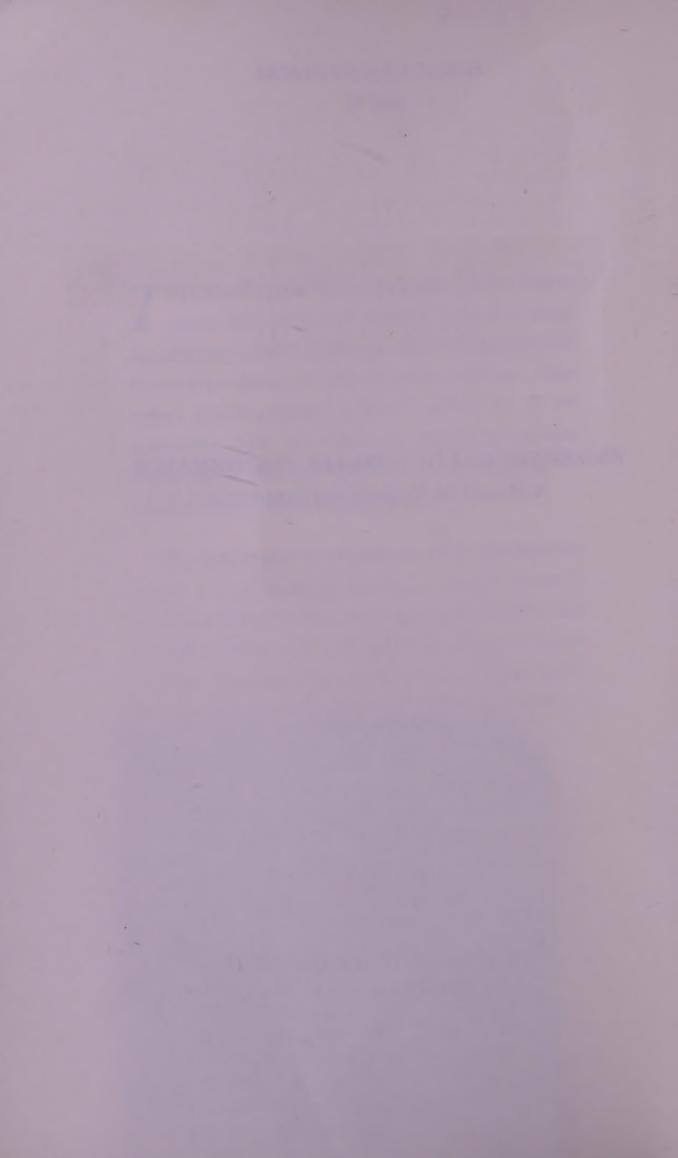

The issues appear at irregular intervals and the series covers a wide range of subjects. A French edition is available under the title Cahiers de Santé publique and a Spanish edition under the title Cuadernos de Salud Pública. Most issues are also available in Russian under the title Tetradi obščestvennogo zdravoohranenija.

ACKNOWLEDGEMENTS

This publication is the product of a collaborative effort in which a number of people took part. An initial draft was prepared in the course of a consultation held in Geneva in August 1978 at which the following participants contributed to the development of the theoretical framework and procedures to be applied: Professor A. S. Elstein, USA; Dr Marion Pollock, USA; Professor T. Varagunam, Sri Lanka; Dr Janusz Wasyluk, Poland; Professor W. Wijnen, The Netherlands; Dr David Ford, WHO Regional Office for the Eastern Mediterranean; and the present authors.

Valuable criticisms of an initial draft were made by those who participated in the consultation, by Dr Karin Edström of the Division of Family Health and Dr J.-J. Guilbert of the Division of Health Manpower Development, WHO, and many others. Dr Pollock made most valuable editorial suggestions, as did Dr J. Gallagher.

The assessment instruments presented were collected in part by Professor Elstein, assisted by Dr P. Abeykoon (Sri Lanka) and Dr J. Wasyluk (Poland). We are very grateful to the authors of these instruments and to many others who provided instruments that unfortunately could not be included for lack of space.

INTRODUCTION

With training, a health worker is expected to be able to:

- immunize a child:
- diagnose and treat chickenpox;
- give nutritional advice to a pregnant woman;
- take action to control an outbreak of cholera in a community.

How can the instructor ascertain if the trainee can in fact carry out these tasks satisfactorily?

How can the instructor diagnose the trainee's difficulties so that appropriate remedial action may be taken?

Do the assessments of the trainee's performance offer sufficient guidance

for future learning?

Such problems are faced by all responsible for training or supervising health workers, be they village health workers, physicians, medical assistants, nurses, or community health workers. Being responsible for helping students to acquire the necessary ability to perform specified tasks, they need to diagnose deficiencies and take appropriate action. They are required to certify various kinds of competence. Moreover, how and what they assess will determine to a large extent what is learned and how health workers function. Faced with these requirements it is essential that everyone responsible for training future health workers or supervising those in service should be able to assess performance adequately.

This is no easy task. It is essential that the assessments made are:

- valid, i.e., that they accurately assess ability to perform the tasks:
- generalizable, i.e., that, although the assessment is based only on a sample, it allows generalization to other situations;
- appropriate, i.e., that the way in which the assessment instrument is framed is suited to the function being assessed.

Unfortunately, few assessment practices to date meet these criteria. Fewer still are procedures that can provide information about a student's or practitioner's total behaviour in health care. Too often, only knowledge as to how the task should be performed is assessed. Other necessary attributes such as interpersonal skills, values, and attitudes are seldom assessed.

Similarly, most assessment practices concentrate almost entirely on measurements of ability to recall or recognize, rather than on ability to apply knowledge or to solve real-life problems.

Too often, therefore, what is assessed is *not* what is really important but what is relatively easy to measure, namely, ability to memorize factual

information.

Another shortcoming is that the abilities or competences assessed are often not, or only marginally, those required by the person in performing his duties as a health worker. What is assessed is not derived from a detailed analysis of job requirements. As a result, much assessment at present is irrelevant to actual health service requirements.

What, then, are the procedures that can be considered adequate for assessing the abilities of trainees and of practising health workers? The present manual sets out to assist teachers and supervisors by providing a set of guidelines on the design and use of methods for the assessment of health workers' performance. To this end the reader is invited to examine, in Chapters 1 and 2, a general approach to performance assessment. Chapter 3 offers a set of principles essential to the effective assessment of individual performance. Chapter 4 then outlines current instruments or techniques that can be applied in assessment. A sequential set of steps in preparing performance assessment is described in Chapter 5, and Chapter 6 presents examples of performance assessment procedures for specified tasks.

Part II of the manual provides the reader with some examples of instruments currently in use for the assessment of health workers'

performance.

The reader not directly concerned with the design of assessment procedures may wish to concentrate on Chapters 1 and 2 and then turn directly to the examples given in Chapter 6 and in Part II of this manual.

Finally, a word of caution. This manual is intended for use by those who design, conduct, and evaluate training programmes and or are responsible for supervising present and prospective health workers. It is not a textbook on educational measurement, a comprehensive review of assessment instruments and techniques, or an analysis of all the issues that may arise in devising, or choosing and using, appropriate assessment procedures in a particular situation. It seeks rather to provide an introduction to some alternative approaches to performance assessment and the main considerations involved in adopting any particular assessment strategy.

Part I PRINCIPLES AND METHODS

CHAPTER 1

PERFORMANCE ASSESSMENT

What is performance assessment? Why is it so important in training health workers and in ensuring the quality of health care?

DEFINITION

Performance assessment is the measurement of an individual's ability to carry out a specified task. The use of the term "performance" is meant to focus attention on the total behaviour of a health worker, including his organization, retention, and use of specialized knowledge, as well as his attitudes and interactions with other people. It refers to the whole range of knowledge, skills, and attitudes acquired through training, as well as their organization and integration in practice.

Because of the variety of factors that go to make up human behaviour and the complex way in which they interact, it may not be useful to make arbitrary distinctions between knowledge, skills, and attitudes. Human beings anticipate. They produce mental plans to guide their functioning. They also monitor themselves to revise such plans, adapting their performance to changes in the problems they face. Performance assessments, then, must address this organizational and adaptive aspect of performance as a whole, not just the elements of performance piece by piece or step by step. This makes the task of designing performance assessments, and the task of a guide such as the present one, more complicated than they might seem at first.

The term "assessment" denotes a generalization made on the basis of an

observation of events.

Since it is impossible to observe everything that is going on, assessment is always based on some kind of sampling. Hence, the aim of all assessment techniques is to systematize the way the observations are to be sampled, recorded, accumulated, and used. The goal is to increase the soundness (i.e., the accuracy and usefulness) of the generalizations derived from them.

The performance assessment of a health worker, then, may be defined as a generalization based on the observation of an individual carrying out a

health care activity.

To clarify this point, it may be helpful to review some recent developments. Not long ago, most educators considered the term "evaluation" to apply mainly to the evaluation of individual students, i.e., to measures taken to judge students' academic progress and to make pass/fail or related certification decisions about them. But as "educational evaluation" grew as a field of inquiry and concerned itself more with educational programmes, institutions, and social policies, the term "assessment" began to be applied to individual students in place of "evaluation". "Assessment" had long

been used in psychology to describe relatively comprehensive measurement at an individual level, as in "personality assessment". In medical education, however, such measurement remained focused on knowledge of the subject matter usually presented in university courses. More recently, terms such as "proficiencies", "competences", and "clinical skills" have come into use to refer to performance, as distinct from knowledge. To be judged competent, a health worker must be able to perform certain activities well.

Here is an example of performance assessment. One task of a health worker is to immunize a child. Performance assessment in this case requires judgement based on observation of the health worker as he carries out this task. The observation necessarily covers such points as how accurately the health worker decides on the dosage required, how he interacts with the child and parent, what follow-up activities he engages in, etc. It therefore involves assessment of a complex, interrelated set of actions in which the health worker organizes his task and adapts to the requirements of specific, often unique situations.

This example highlights the need for performance assessment techniques focusing on complex field performance. It is essential also to consider the total event rather than distinct events or elements of a sequence of behaviours. Simple distinctions between knowledge, attitudes, and skills—all elements of the performance—are therefore not useful. Nor can this total performance be assumed to equal the sum of its parts. The performance of a health worker in a complex task cannot be assessed by examining his behaviour in small segments or elements of the task.

PURPOSES

There are many reasons for performance assessment. For the student and teacher or supervisor it provides information on the quality of a given performance. In that sense, it is diagnostic, permitting the student and instructor to decide whether remedial action needs to be taken or if more remedial instruction should be given. It provides "feed-back" to both students and teacher, the latter gaining information on ways in which the programme of instruction may need revision. This *formative* process should be maintained throughout any programme of instruction or supervision. In the latter case the feedback is to the health worker and supervisor.

The purpose of *summative* assessment is to decide if an individual student should be promoted, selected, or certified (re-certified) as having the ability required to act as a health worker. At the programme level it identifies shortcomings necessitating modifications of the programme.

Thus the purposes of performance assessment fall into the four following categories:

Institutional level

Individual level

Formative

(feedback (decision purposes)

Programme Programme adoption
Diagnosis of Selection

deficiencies Certification of

Remedial action ability Self-evaluation Promotion

It should be apparent that formative assessment, because it provides feedback to students and health workers on their performance serves as a continuing guide to the planning of further learning opportunities.

Summative assessment provides for certification by the training institution of the ability of each student. It reaches back as an evaluation of the adequacy of aspects of the training, and forward as a means of predicting field performance.

Beyond these roles in training, performance assessment is an essential requirement for the evaluation of existing health services and thus necessary for improvements in health care. By focusing on what the health worker actually does, performance assessment provides the most direct means for measuring the quality of health care.

CHAPTER 2

A FRAMEWORK FOR PERFORMANCE ASSESSMENT

The resource to which it is usual to turn for assistance in choosing, adapting, developing, or evaluating performance assessment techniques is educational and psychological measurement. There are many internationally known textbooks on the subject, as well as publications that define professional standards for assessment instruments, providing guidance on both the technical and the ethical issues involved in assessment.

Several publications have dealt with assessment techniques applicable in the training of professional health workers. These give, however, little or no attention to performance assessment as we have defined it, concentrating instead on the methodology of examining students' knowledge in a classroom or examination centre. The methodology or instruments they describe are applicable mainly to professional students with high verbal skills and experience in traditional written examinations.

TASK ANALYSIS

In the approach to performance assessment advocated here, the first essential step is to identify the tasks of a health worker.

Health care workers face many tasks and problems in their day-to-day work and have to carry out or solve them as best they can. To assess total performance, it is helpful to break down each job into components or elements that can be more easily observed and studied. Such a breakdown helps, too, in giving better feedback to the person assessed. The feedback can focus on those job elements that the health care worker should think about, study further, or practice.

Breaking down a job into its components in this way is usually called "task analysis", a process in which different elements of a job are identified at increasing levels of specificity. This is illustrated in Fig. 1, in which an analysis of both the job and the person's behaviour in performing it is shown schematically. The total job is broken down into its several performance functions or general activities. (A, B, etc.). Each function is composed of several tasks (A1.1, A1.2, etc.), each with associated competences. This process of analysis could in theory be continued indefinitely.

An important question arises. How far should this process of differentiation be taken? For example, in the measurement of blood pressure, several performance components can be distinguished: putting the patient

Such as CRONBACH, L. J. Essentials of psychological testing, 3rd ed. New York, Harper and Row, 1970, EBF1, R. L. Essentials of educational measurement. Englewood Cliffs, NJ, Prentice Hall, 1972.

² AMERICAN PSYCHOLOGICAL ASSOCIATION. Standards for educational and psychological tests and manuals, Washington, DC, American Psychological Association, 1974.

at ease, placing the pressure cuff on the arm, interpreting the reading. These could be further broken down into such elements as muscular movements, special thought processes, recall of special facts, etc. The determination of the appropriate, i.e., useful, level of differentiation will vary according to the purpose of the assessment. No one level will necessarily always be the right one. In general, however, because the behaviour of human beings cannot be understood by observing separate and distinct acts, the assessment of very specific competences is often not useful. It is necessary instead to assess the complex set of interrelated actions characterizing human behaviour. Too often, a preoccupation with the detailed listing of very specific competences has resulted in meaningless data, since the essential organization and adaptive behaviour of the individual were not assessed. It is often the total sequence of actions that is important, and that is not simply a sum of all the separate actions involved in a task. It is for this reason that performance assessment must be concerned with more general competences.

For certain special purposes (e.g., identifying particular weaknesses of students) more detailed analysis may be necessary. However, in most cases assessment of general performance also permits the detection of critical elements at a lower level if that is needed.

Table 1 presents some major functions and constituent tasks of maternal and child health care. These are performed by several categories of community health worker—in this case, medical assistant, public health midwife, trained traditional birth attendant, and community health worker.

Obviously both the functions and the job categories will differ, depending on the situation. Each task in itself contains a range of actions (components of tasks). Hence it is essential to define the total components and the competences required in order to carry out each task. This implies a detailed analysis of what the tasks will entail for each worker, and what his or her resources are for handling it. The crucial question is: "What must the worker know and be able to do to complete a given task successfully?" For instance, for the function "screening for high risk cases", three main tasks are identified. What must the worker be able to do in order to perform each of these tasks well?

The relationship between performance assessment and task analysis

A task analysis is only the first step in the development of performance assessment. It indicates what needs to be accomplished, or what the health worker needs to be able to do.

There are two main ways of obtaining the relevant information:

- Field observation of workers actually doing the task, particular

Typically, "a health worker with eight to nine years' basic general education followed by two or three years' technical training which should enable him to recognize the most common diseases, to care for the simpler ones, to refer more complicated problems and cases to the nearest health centre or hospital, to carry out preventive measures and to promote health in his district" (World Health, June 1972).

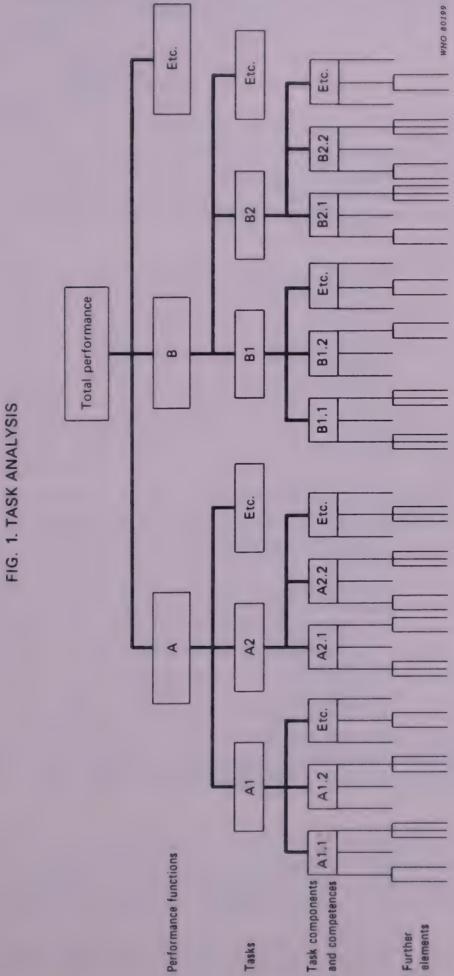

TABLE 1. MATERNAL AND CHILD HEALTH TASKS TO BE PERFORMED BY DIFFERENT CATEGORIES OF HEALTH PERSONNEL OUTSIDE HOSPITALS

⁺ The task is normal for this category of worker.

attention being paid to aspects of performance that may be crucial to success or failure ("critical incidents"). Note that the organizational and attitudinal aspects of performance must be considered. In some instances the sequence of procedures or actions is important and so needs to be identified.

— Interviews with health workers, which are particularly important in order to discover the reasons for their actions.

O The worker can carry out initial observation or examinations and some treatment, referral only if necessary

R Immediate referral to a higher level is indicated, and emergency treatment when possible

⁻ The task is outside the normal range of responsibilities.

Other procedures used are:

- work diaries
- records of actions taken and records of patients
- surveys of consumers
- patient-flow analyses
- simulations.

The information thus obtained is then used to identify the essential task components. Once these are established, it is possible to construct the necessary methodology for an assessment of performance.

Before considering this methodology, a number of principles need to be

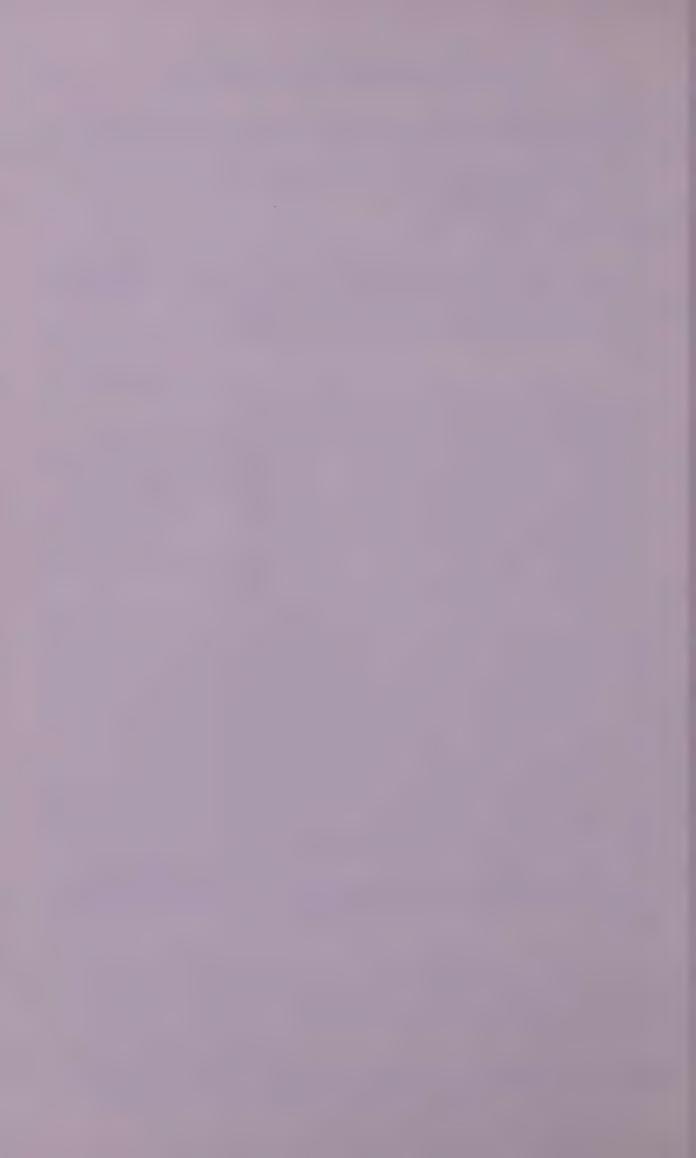

stated:

- A task analysis, no matter how comprehensive or well done, is only an abstraction of an actual job performance.
- The nature of any job will change with time and circumstances.
- Performance assessment designed to measure competence at every level of a task hierarchy is often removed from actual practice—particularly so, if the assessment is made in other than a field setting, i.e., in other than in a health service situation.
- Performance assessments made during or at the end of training are removed in time from practice. There is therefore the problem of predicting future performance in different settings.

It is important to realize that performance assessments designed to measure competence for a job or task are inescapably imperfect because of measurement errors, and because task components can never represent the total job. Many other factors such as the conditions under which the assessment is made and the personal characteristics of those being assessed (e.g., motivation and changes that are likely to occur in the job and in the person) necessarily affect the predictive capacity of any assessment.

Furthermore, measurements of performance on specific task components cannot be related closely to total performance because each of them reflects only a small portion of it. They cannot be summed up and presented as the equal of total performance because it is not simply a sum, but rather a complex of interrelated and interdependent components.

How then can any assessment be judged correct or true? How can it be validated? These are the general questions to be considered in the next chapter.

CHAPTER 3

ASSESSMENT STRATEGIES: GUIDING PRINCIPLES

The principles in the following list are intended to provide guidance on the development of assessment instruments. They can also be used by a teacher or supervisor to judge how far an instrument developed in another situation meets acceptable professional standards.

PRINCIPLE 1. RELATIVE IMPORTANCE OF ACTIVITIES

Assessment should focus upon the most critical aspects of the job as a whole. As shown earlier, a task analysis identifies an array of functions and tasks that may be assessed. Since no assessment can be truly comprehensive, the assessor must judge the relative importance of the different aspects of performance to the job as a whole. Questions to be asked include: "Is this a critical aspect of the job, i.e., is the condition for which action is needed prevalent? Would failure have a serious effect on patients, or would it seriously affect the worker's performance generally? Is it something that nearly all health care workers in a given category can be expected to have mastered? Is it a subordinate component that can be assumed to have been mastered if a superordinate component is shown to have been mastered?" From the answers to such questions, the assessor can construct a priority list. While no aspect of the job should be exempted from assessment on this basis alone, such a list gives the assessor a basis for deciding how time and effort can best be invested for the development of adequate instruments.

For example, if surveying a village for malaria prevalence is an essential function, a task of the health worker is to detect enlarged spleens by abdominal palpation. This task is a critical component of the function. The overall assessment should include a test of skill in such detection. An assessment that does not include such a test will fail to ensure that health workers can satisfactorily perform the activity of surveying a village for the prevalence of malaria.

PRINCIPLE 2. PRACTICABILITY AND COST-EFFECTIVENESS

Assessment techniques should be chosen that are practical and yield the greatest useful information for the least cost in time and money. If a performance assessment (however ideal in conception) is very costly or takes too much time, it is not appropriate and hence should not be used. An assessment must be practicable in a particular situation. Hence the assessor may have to discard a first-rate plan that is too costly, or for which the technology is lacking, and use a less than perfect plan that can be implemented.

Cost must always be considered. The assessor should concentrate on the most important aspects of performance and seek to develop cheap and convenient methods. If this is kept in mind, the limited resources for performance assessment can be spread, thereby increasing the representativeness of the assessment.

An example is provided by some medical schools in developing countries, which use electronic simulators that reproduce with high fidelity the sounds heard in diseased hearts. These elegant instruments can assess the auscultatory skills of students, but are very expensive. The money spent on such gadgets could very well be used to develop ways of measuring other important functions, and the ability to detect deviations of heart sounds could be tested more cheaply with simple audiotapes, phonograph records, or actual patients.

PRINCIPLE 3. REPRESENTATIVENESS AND CONTENT VALIDITY

The performances assessed should represent the full range of competences for the functions and tasks demanded by the job. Most functions and tasks require particular knowledge, certain skills (including interpersonal skills), practical decision-making, and positive attitudes. All of these should be assessed. The assessor should guard against the temptation to measure what is relatively easy to measure, and at all times be concerned with the totality of behaviours and skills required to perform a task well.

As far as possible the setting in which assessment is made should resemble the real work situation. In practice, however, all assessments will include some artificial elements. This is often necessary and sometimes even desirable, since in a simulated situation conditions can be controlled and

feedback given.

Assuming that a task analysis has provided a definition of the content of the job, it is essential for the assessment techniques used to obtain samples that are representative of every aspect of this content (N.B., it is always necessary to sample). If the assessment is designed to yield such representative samples it has "content validity", no important function or task will be omitted, and none will be given weight out of proportion to the job.

An adequate assessment plan is often a compromise between the three

principles just reviewed.

PRINCIPLE 4. MULTIPLE MEASUREMENT

The most important and critical aspects of performance should be assessed by more than one method or approach. Because the functions of health workers are so varied and complex, no single formula or strategy for performance assessment can adequately assess all of them. Different combinations of knowledge, technical skills, decision-making and problem-solving capabilities, and attitudes will be required, depending on the future functions and tasks of the worker concerned. A variety of

instruments must therefore be used and the best combination will depend on the functions to be assessed and the resources of the evaluator.

Even though one way to ensure accurate measurement is to use more than one method, every method has some shortcomings. If two methods are used to measure one performance function, such weaknesses may cancel one another out. When different means of measurement agree despite different weaknesses, confidence in the assessment is increased.

A good example of this principle is provided by the assessment of a health worker's ability to communicate with patients. This can be assessed, using a suitable checklist as a guide, by observing him as he talks with a patient. It can also be checked with the patient after the health worker has talked with him. When the conclusions agree, one can be reasonably confident of their validity. In order to ascertain whether successful communication between health worker and patient had taken place, the patient's subsequent behaviour might also be observed to see whether his talk with the health worker had produced the desired effect.

PRINCIPLE 5. PREDICTIVE VALIDITY

Performance assessment should be predictive of future performances of the same task or function. As noted above, representativeness of sampling ensures the content validity of the assessment, and multiple measurement of important functions heightens the validity of the means employed. But validity is not a "property" that an assessment instrument "possesses" in itself. About any form of measurement, one question must always be asked: "Valid for what purpose?" Predictive validity is a third aspect of correctness in measurement.

When the performance of students or health workers is assessed, the teacher or supervisor is concerned ultimately with how they will perform in similar situations later on. As far as possible, assessment should predict future performance.

It is realized, as has already been pointed out, that assessments made during or at the end of training may not correlate well with later performance. Conditions change and so do people, and the limitations of assessment as regards prediction of future behaviour must be recognized.

Moreover, an assessment can only measure whether a health worker can do something. It cannot tell us that he will do it, or will perform in the same manner subsequently. For example, if a student or health worker knows he is being assessed in his work by his supervisor, he will naturally want to perform at his best. Also, students are often assessed on only one problem or case at a time and can give it their undivided attention. In practice, however, a health worker usually has to deal with several problems simultaneously. The mental effort of managing several patients in quick succession is likely to lead to occasional slips and errors that might not occur with only one patient and plenty of time. In this respect, therefore, assessment situations are often "artificial".

Generally an accurate assessment of a student reflects the potential upper limits of his future performance of a similar task.

PRINCIPLE 6. RELIABILITY

A performance assessment should have stability and internal consistency. In addition to validity, correct assessment requires precision in measurement. This aspect is usually referred to as "reliability". One indication of reliability is internal consistency, i.e., how well subscores on similar items within, for example, a test or rating scale agree with one another. Stability, the second requisite for reliability, is demonstrated when assessments of the same students for the same task at two different times agree with one another.

When observations are used in assessments of this sort, reliability is established on the basis of agreement between the findings of the observers or judges concerned. A related concept is "objectivity", that is, that the assessment should not be unduly influenced by the personal biases of the observer or judge.

In recent years, the quest for objectivity, and hence for greater reliability, in medical education has led to the increased use of multiple-choice examinations in which the correct answer or combination of answers is determined by a panel of experts before the test is administered.

But there are important aspects of a health worker's performance that cannot and should not be assessed with such tests. In fact, they have a very limited use in performance assessment. Generally, performance is better assessed by so-called subjective measurements. For example, ratings of a worker's effectiveness in relating to patients can be easily and conveniently obtained from the patients themselves. A series of patients may be asked questions such as "Did you understand the directions the doctor gave you?" or "Did you feel comfortable talking with that nurse?" Their replies will unquestionably be subjective for they depend upon perceptions and personal feelings. Yet to obtain a convenient, inexpensive, and feasible assessment of a worker's interpersonal skills, this may be a satisfactory technique. If the statements of a patient agree in general with those of the other patients questioned, this suggests that the assessment is reliable.

Here a word of caution is needed about the distinction frequently made between "subjective" and "objective". Objectivity is simply a matter of reliability, which in turn can only be understood in terms of generalizability. Assessments are always subjective in that they involve judgement. Objectivity is established when, for the same performance, similar results are obtained with different observers, or different items, or scales or measures, and it is thus possible to generalize from one observation or measurement to another.

Although reliability is desirable, it should not be such an overriding principle of assessment as to blind one to the need to assess other aspects of performance that, by their very nature, call for more personal, subjective means of measurement. And, while agreement between raters is important, variation among them, whether they are teachers or patients, may tell us something about the natural variability of a student's performance rather than reflect "subjectivity" or "error" in measurement. If an assessment of a student's performance varies with time, we also need to know how much of the variation is actually due to changes in competence and how much to other, undetermined factors in the measurement. The "trade-off" between more objective and more subjective measurement should be considered each time in the light of the aspect of performance to be assessed.

PRINCIPLE 7. INEVITABLE COMPROMISES

The purpose of assessment should be considered when choosing among assessment techniques. A compromise between relative importance, cost-effectiveness, and content validity has already been noted in connexion with Principles 1, 2, and 3. The compromise, or "trade-off", between more objective and more subjective approaches to measurement has also been noted. Many such compromises are inevitable in any assessment plan. There is a particular need to compromise between reliability and validity—this is often called the "band-width fidelity" dilemma. To increase the reliability, i.e., the fidelity or accuracy, with which any function or competence is measured, the length of the assessment instrument is increased, thus permitting additional observations. However, this entails a reduction in the number of observations of other critical functions or competences. The band-width fidelity of the instrument has been reduced and thus the content validity and possibly also the predictive validity of the assessment.

Broad band-width is needed in assessments of health care functions because of the wide spectrum of responsibilities and activities that is usually involved. Consequently, it is necessary to compromise to some extent on the fidelity with which any one function is assessed, otherwise the length of the instrument becomes a problem. Of course, different purposes of assessment will demand different kinds of band-width compromise.

PRINCIPLE 8. ASSESSMENT AS A GUIDE TO LEARNING

Performance assessment procedures should provide a guide to student learning. Since what and how a student learns will be markedly influenced by how he is assessed, it is essential that the form or procedures used are clearly related to learning requirements. In terms of content, this means that if the assessment concentrates on health care competences, students are more likely to become concerned with health care practices. If the assessment focuses on recall of factual information, the student is likely to concentrate on learning facts or storing information.

But it is not only the content but also the process used that is important. For instance, the exclusive and constant use of multiple-choice tests, or of essays, or of short-answer tests can influence students to learn selectively only what is assessable by a particular form of examination.

CHAPTER 4

ASSESSMENT TECHNIQUES

TECHNIQUES USED IN CONVENTIONAL EXAMINATIONS

The traditional ways of assessing student knowledge in most educational programmes for health personnel commonly include the following types of test:

- -- essays
- short-answer (completion) tests
- oral tests
- multiple-choice tests.

There are many publications that review the different techniques employed, the construction of the tests, and the interpretation of the results. Such tests can play an important role in performance assessment if properly used as part of a more general assessment.

Each has some strengths and weaknesses. For instance, the essay can be used to measure the student's ability to organize, integrate, or synthesize information. It can also be used more effectively than short-answer or multiple-choice tests to measure originality or innovative approaches to problems. The multiple-choice test is more likely than the essay to lead to adequate sampling of factual information and to inter-examiner consistency in analysis or scoring.

All these approaches concentrate mainly on assessment of knowledge and often on memory (recall and recognition) of information. Apart from the oral examination, they obviously are suitable only for trainees with a high level of literacy.

Because multiple-choice tests have recently gained in popularity and are increasingly used in the assessment of students in the health professions in many parts of the world, an additional comment seems appropriate.

The multiple-choice form of assessment is attractive in that it has the advantage of objectivity in marking. The tests are relatively easy to score and lend themselves to mechanical scoring and analysis, thus apparently saving valuable time for teachers and supervisors. However, the papers take more time to set than do those for essays, short-answer tests, or oral tests. The time is thus merely shifted from test-scoring to test-setting, at least if the setting is done properly (and a badly designed test has no merit at all). Caution is therefore indicated in the use of this technique. As with all assessment, the assessor must be clear as to why he wants to assess, what he wants to measure, and who the candidates are.

¹ See, for example: CHARVAT, J. ET AL. A review of the nature and uses of examinations in medical education. Geneva. World Health Organisation, 1968 (Public Health Papers, No. 36), GUILBERT, J. J. Educational handbook for health personnel Geneva, World Health Organization, 1968 (WHO Offset Publication No. 35).

In general, none of these techniques yields valid assessments of field performance. Although a certain minimum of reliability is required of any means of assessment, the crucial requirement is validity. This is emphasized here because too often in recent times the emphasis has been on obtaining greater reliability and objectivity, often to the detriment of validity. As a general rule, a test is worthless, however great its reliability, however "objective" it appears to be, if it does not measure abilities important in enabling the health worker to carry out the health care functions for which he is responsible.

It is therefore essential to use or develop other approaches that offer advantages in validity without significant losses in reliability. For example, the best way of finding out whether a health worker can take the history of a woman in the second trimester of pregnancy is not to set a series of multiple-choice questions asking, in effect, what are the major points to be covered in such a history. Instead, the teacher or supervisor should develop a check-list of these points and use it while directly observing a series of student-patient encounters. In this case it is the student's actual performance with patients that is assessed, not just what the student recognizes as correct among a set of alternative actions laid before him. Direct observation like this is often a valid means of measuring the student's competence in taking the history, and the use of a check-list increases reliability in that it structures the observer's ratings (thus increasing the potential for inter-observer agreement).

A case can also be made for oral examinations in the field. During or immediately following an actual performance, an observer can ask questions (e.g., "Why did you do . . .?" "What would you have done if . . .?" etc.) to assess dynamic organization and use of knowledge in real problem-solving situations. Such assessments may lack reliability for some purposes, but they can provide a rich and representative description of knowledge being applied. Oral questions that require only reproduction by rote of memorized knowledge have no place in field assessment. They should be used only in training, if at all.

FIELD OBSERVATION: CHECK-LISTS AND RATING SCALES

The most obvious and essential procedure in performance assessment is careful observation of a health worker in an actual service or field setting. There can be no substitute for such observation in actual practice. It is the most direct, timely, and inexpensive means of performance assessment.

The observations have to be sound and accurate, which is to say that they must have validity and reliability. It is the task of the assessor to organize observations so that data will be collected systematically and will be comparable among different observers. For this, the observers will need guidance in the form of check-lists and rating scales, which they must be trained to use.

Check-lists require the observer to judge whether certain behaviour has taken place (for examples, see Part II of this manual). They can be used most effectively when components of performance can be specified in detail. It is then possible for the observer simply to note whether the prescribed behaviour has taken place or not. For example, a check-list could be used in observing the activities of a health worker taking blood pressure or giving an injection. The actual physical or psychomotor skills involved can be fairly precisely stated.

Carefully prepared check-lists can be used, however, for more complex

kinds of performance (see Part II).

In many cases, the observations must cover factors other than whether something was done or not. One such factor is sequence. Some actions must be performed in a certain sequence if a given task is to be done competently. Most laboratory procedures, and some physical examinations, fall into this category. Often, however, the fixed sequence prescribed by some instructors is not only unnecessary but positively harmful. For instance, in medical history-taking, strict adherence to a routine would be ineffective and inefficient. Hence a fixed sequence of actions should not be required or figure in assessment, unless it is essential to the task.

There are other aspects of performance that do not lend themselves to assessment by check-list. For example, the important aspect known as "attitude" or "style" is part of all interactions between health workers and others—patients, village elders, fellow members of the health team, etc. and thus needs to be included in performance assessment for many functions. Interaction with others, or personal style, can be observed and assessed by means of a check-list, but not easily. A "correct" list of acts or components of behaviour can rarely be prescribed in this connexion. Rather, the assessor-observer recognizes that, while a certain observed sequence of behaviour may seem to fit the situation well and leads to the desired outcome, another health worker might have used an entirely different sequence and arrived at the same effect. Rating scales are more likely to provide a better record of such aspects of performance than checklists. The observer can take informal notes as he observes the health worker in the interpersonal transactions of the task. He will especially note critical exchanges that reflect different personal styles or attitudes. Later, the observer will sum up his impressions in ratings on one or more scales. His notes ought to provide a justification for the rating as well as a basis for more detailed feedback to the worker or trainee.

A rating scale requires judgements by the observer on how well the performance meets specified criteria. This is particularly useful when there is no set routine, but a number of alternatives, or when the health worker is required to adapt to local characteristics and variations.

In the case of workers taking blood pressures, for example, a rating scale could be used to assess how they interact with patients and whether they succeed in putting them at their ease. Another case in which a rating scale would be more appropriate than a check-list is the assessment of a health

worker's performance in persuading village elders to change a sanitation practice.

Whether to use a check-list or a rating scale is often a matter of personal choice, and no strict guideline in the matter can be laid down. For many aspects of performance either would serve. In general, however, check-lists serve assessment especially well when the components of performance can be specified in detail and follow a routine. Performances for which there is no single routine, but a number of alternatives, or which require the health worker to adapt to local characteristics and variations, are probably better served by rating scales.

Finally, although it has been stated that observation in actual field conditions is undoubtedly the preferable approach in performance assessment, the means described above—check-lists and rating scales—are also applicable to assessments in other settings, e.g., in classrooms, examination centres, etc. In certain cases, the simulation of conditions encountered in practice may have some advantages.

SIMULATION

Many aspects of health care may be simulated for assessment purposes. Simulation has the advantage of approximating reality while retaining the standardized character of the traditional examination, and it avoids some of the disadvantages of working with patients.

For example, to assess ability in diagnostic problem-solving and decision-making, the thought processes and intermediate judgements of the trainee should be investigated. The assessment should concern itself with ability to obtain information from patients, problem formulation and hypothesis generation, data interpretation, integrative diagnostic judgement, and choosing between alternative courses of action. The observation of encounters with patients has immediate appeal and high content validity, but using patients may be less desirable than using specially designed simulations. These can include written case-histories and "paperand-pencil" patient management problems, patient simulation, and oral examinations in which an assessor or instructor plays the part of the patient and evaluates the student's performance at the same time. In such encounters, planning and reasoning can be displayed more clearly and openly than is usually possible with real patients. The student can be asked to explain the reasons for a particular action, either orally or in writing, and can discuss strategic alternatives and doubts, indicate points of uncertainty or confusion, and state why a particular decision was taken. By contrast, in typical interactions with patients, the thought processes underlying clinical decisions are not displayed and the student or health care worker is understandably reluctant to show doubt or uncertainty. For performance assessments, therefore, some simulations are of greater content validity than clinical encounters.

There is another argument for simulation. Assessment validity will

generally be increased by more extensive sampling of relevant events. But the time available for assessment is limited. With paper simulation less time is usually spent per case than with actual patients, and a wider sampling of different kinds of cases is possible. For this reason also, the use of simulations may have greater content validity than the use of a series of unselected patients, although the latter would appear at first sight to be more valid.

INTERVIEWS

Often the assessment of performance requires not only systematic observation of the health worker in a field situation or simulated practice setting, but much useful information can also be gained from interviews with persons with whom the worker has been in contact in the course of his work, e.g., patients, team-members, etc.

Here again it is important to be systematic. Guides on interviewing should be prepared, and those conducting interviews should be trained. It is only in this way that some degree of consistency can be attained.

A special form of interview is the oral examination cited earlier as one of the conventional techniques of assessment. The use of oral examinations has become less popular as evidence has accumulated of their low reliability and doubtful content validity. In addition, they are time-consuming. However, an oral test—i.e., a careful interview—can often make an important contribution to performance assessment. It may often be easier to ask the trainee or health worker for an explanation, or comments on alternative actions, than to use techniques such as short-answer or multiple-choice examinations.

PERFORMANCE PROFILES

Once information has been collected by means of observations in the field or a simulated practice setting, using check-lists, rating scales, observation schedules, and conventional examination techniques where appropriate, it is necessary to summarize the findings and pronounce on the performance.

Data obtained from several assessments are not easy to combine. The widespread practice of adding together scores for different performances to arrive at a single general judgement cannot be recommended. The competent health worker would not add together a patient's temperature and blood pressure readings to constitute a general health index. The competent assessor avoids the analogous practice of averaging performance data.

Different assessment purposes call for different treatments of the data. A generally useful practice is to construct a performance profile, which shows a pattern of performance across different aspects of the job, and for different workers, without recourse to total scores.

This profile is based on a rating scale. In the following example, a five-point scale is used with "unacceptable" and "acceptable" as the extremes. In addition, another point is prescribed as the "minimum acceptable performance standard", usually on the basis of an arbitrary decision that should be taken before the profile is used. It can be determined by identifying essential tasks or task components that must be satisfactorily accomplished, or by the reverse process, i.e., by identifying behaviour incompatible with an acceptable performance. In either case, a rating less than that specified is unacceptable.

Hypothetical profiles for two health workers, constructed at the level of function, are shown below (Fig. 2). The profiles represent the antenatal care functions in the maternal and child health matrix. For each function the scores of two independent observers are shown. Each observer has used a check-list to assess performance on each of the tasks and task components and then recorded a rating on a continuous scale for each function. The two observers' ratings agree for the most part, but diverge occasionally, particularly for health worker 2. Note that a minimum performance standard has been stipulated.

FIG. 2. PERFORMANCE PROFILES MINIMUM ACCEPTABLE PERFORMANCE STANDARD UNACCEPTABLE **FUNCTIONS: ACCEPTABLE** 3 **PREGNANCY** DIAGNOSIS SCREENING & B IDENTIFICATION OF HIGH RISK C HEALTH **EDUCATION** D PRIMARY **INTERVENTIONS** SECONDARY MONITORING WHO 80200 X = rater 1Health Health worker 1 worker 2 Y = rater 2

The performance of health worker 1 in all functions is judged acceptable by both observers, but some weakness is noted in "Screening and identification of high risk". On noting this, a teacher, student, supervisor, or worker could consult the check-list for this function to find out which performance components needed to be strengthened. Health worker 2 shows inadequate performance on two functions, but the judges disagree somewhat. Again, the check-lists for these functions can be consulted to decide what the worker must do to improve his performance.

Profile patterns may also have implications for the training programme. Suppose that a number of workers in one place showed profiles similar to those of workers 1 and 2. A teacher or supervisor might then conclude that training for function B—"Screening and identification of high risk"—

should be revised.

CHAPTER 5

PLANNING ASSESSMENT STRATEGIES AND PROCEDURES

The material in the previous chapter can be restated as a series of steps for planning a performance assessment strategy and procedure. All the steps are necessary, but how they are carried out and the order in which they are taken will vary.

Sometimes the assessor finds that steps 1-4 have already been taken; they are prerequisites to assessment, and to some extent require different skills and knowledge than do the later steps. When they have not been taken and the necessary expertise is not available, the assessor must carry them out.

Steps 5–13 are the principal responsibility of the assessor, i.e., the person primarily concerned with the design and use of performance assessment. In addition, he has to ensure that steps 14–15 are planned and responsibilities for them assigned. Steps 14–15 are the most important follow-up steps since they involve specialized expertise. Considerable expenditure of effort and additional manpower resources (consultants) may be required.

PREREQUISITES

Steps 1-4

The purpose of these procedures is to ensure that job functions and tasks are identified. These are sometimes already identified and available from the Ministry of Health or can be inferred from the institutional objectives of the training programme. Where they are not available, the task of identifying them falls to those responsible for designing performance evaluation.

- 1. Identify job(s) for which performance assessment is needed and which meet priority health needs.
- 2. Conduct a job analysis to identify general activities or functions; divide these further into tasks and task components, using some combination of expert judgement, observation of job performance, interviews with workers known to be effective on the job, and other procedures that permit identification of job elements.
- 3. Identify the job functions and tasks that are most critical for health care, and thus for job success, and that are feasible.
 - 4. Identify all other job functions and tasks that will be assessed.

PLANNING THE ASSESSMENT PROCEDURES

Steps 5-13

The purpose is to provide those responsible for training or supervision with valid and reliable techniques for performance assessment. The techniques will give appropriate guidance to students or health workers on what is expected of them.

- 5. Decide the levels at which assessment will be made—functions, tasks, and/or task components—taking into account the relative importance of the tasks and the cost of assessment.
- 6. Choose the approaches and techniques that will be used to measure performance in each function and task. Decide which performances, if any, need multiple measurement.
- 7. Select all required instruments (procedures) or, where necessary, design them.
- 8. Arrange for a review of these instruments by other experts who know the jobs to be assessed, as well as the conditions in which the instruments are to be used, and have some knowledge of performance assessment. This review should check the representativeness (content validity) of the set of instruments and whether the measurements chosen are suitable. Revise or adjust as necessary.
- 9. Conduct a pilot study of the instruments. This should include an estimation of reliability, and checks on whether the set of instruments is practicable and feasible, whether the instructions are adequate for the health care workers being assessed, whether those who will use them are adequately trained and instructed, and whether there are other factors that could affect the assessment strategy. If possible, check also how far multiple measures of a function or task agree with each other.
- 10. Revise the provisional assessment instruments as needed, on the basis of the results of the pilot study and any other reviews. Adopt the final assessment plan.
- 11. Plan the data-recording procedures. Design the standard performance profile record that will be used to summarize results for each health care worker.
- 12. If indicated, establish minimum acceptable performance standards for each function or task to be assessed. This calls for the judgement of experts such as those referred to in step 8. The standards might in fact be established as part of step 8. How step 12 is carried out will depend on local conditions and the specific purposes of the performance assessment.
- 13. When indicated and possible, arrange for a study of the predictive validity of the assessment instrument. Sometimes this step can be included in the pilot study carried out as part of step 9, or a separate pilot study may be required. Occasionally, a predictive validity study can be made in the course of the assessment itself.

FOLLOW-UP

Steps 14-15

Follow-up activities are often neglected, but they are an important part of planning and adopting an assessment process. It is only through such activities that an assessor can satisfy himself and others that the process is adequate and is achieving the desired results. They constitute an evaluation of the assessment procedure itself.

- 14. Design a procedure to monitor the adequacy—including the acceptability—of the assessment procedures. Useful sources of information are other teachers, supervisors, other assessment experts, observers, and health workers.
- 15. As assessment data accumulate, examine performance profiles for each job, function, or task. From these, a distribution of profiles can be made that allows a revision of the minimum standards established in step 12, if this is necessary.

SELECTION OF ASSESSMENT PROCEDURES BY USERS

The development of a methodology for performance assessment is obviously the task of specialists who have had some special training in educational measurement. However, every teacher or supervisor of health personnel will need to engage in performance assessment as an essential part of his or her duties. The following steps are recommended for the non-specialist concerned with application, i.e., the use of assessment procedures already developed.

Prerequisite steps

These are the same as those suggested for planning assessment procedures. Any user of performance assessment will need to have identified the functions and tasks for which his students are being trained or that the health worker who is being supervised must carry out. Hence the user must first proceed in accordance with steps 1-4 outlined above.

Process of selection

The selection of appropriate procedures will involve:

- 1. Identification and listing of all functions, tasks, and task components to be assessed by the procedures.
- 2. A review of techniques and instruments already being used, whether locally or in other settings (examples, which will be updated from time to time, will be found in Part II of this manual).
- 3. Selection of the most appropriate techniques on the basis of the pilot study. Examination of any data available for predictive validity and reliability.

- 4. A review of the selected procedures by colleagues familiar with the jobs to be assessed and by students and health workers who are to be assessed.
 - 5. Organization of a pilot study (see step 9 above).
- 6. Revision of the tentative procedures on the basis of the results of the pilot study.

Interpretation

The user of any assessment procedure ultimately has to answer two questions:

- 1. Can the health worker perform the specific function?
- 2. Can the health worker be certified as competent?

If the assessment uses the approach suggested here, i.e., breaking down the total job into functions and their component tasks, both questions are in principle the same. In each case total competence is judged on the basis of information about the component parts of a function. The ultimate judgement remains subjective and should be made by experienced practitioners. The validity of the judgement will be enhanced if the following principles are borne in mind:

- 1. The judgement depends on the purpose of the assessment. If the purpose is to diagnose the student's strengths and weaknesses in order to help him in his learning, it is best to draw up a profile of his performance, so that he can see where he needs to improve.
- 2. Total performance cannot be judged simply by adding up the scores recorded in tests of its component parts. The total performance has to be observed by the assessor and when he decides intuitively that it is "not up to the mark" he should identify the shortcomings in order to give useful feedback to the student.
- 3. When assessing the performance as a whole, adequate weight should be given to the more important components. For example, if a student does not prescribe morphine for acute left heart failure, he cannot be certified as competent to manage cardiac emergencies, however well he scores in the other aspects of management of cardiac emergencies.
- 4. When information on the predictive validity of the instruments of assessment is available, it should be taken into consideration. Particular reliance should be placed on data obtained through instruments known to be of high predictive validity.

TWO EXAMPLES OF PERFORMANCE ASSESSMENT PROCEDURES

The two following examples are given to illustrate the procedures

outlined in the previous chapter.1

The function or general activity to be assessed is part of antenatal care, more specifically "screening for or identifying high-risk cases". The tasks are "history-taking" and "measuring blood pressure". Hence, the purpose of the assessment is to determine the competence of students or health workers to collect valid and reliable data from a pregnant woman as a

prerequisite for deciding on appropriate care or management.

The decisions to be taken will necessarily vary in different situations depending on the organization of the health care system and the availability of personnel and facilities. Similarly the data collection involved will depend on the circumstances prevailing in the health care system, notably the time and facilities available to the health worker. For example, in some settings a worker may be expected to identify abnormal or potentially problematic findings and to refer them to other categories of health worker. In other settings, the collection of data is part of a set of responsibilities that include interpretation of the data, problem formulation, and deciding on management.

The specific tasks "history-taking" and "measuring blood pressure"

have the following components:

1. History-taking

- obtaining sufficient data relevant to the decision to be made

 establishing communication with the patient that will be supportive to her and facilitate her responsiveness to the health worker

The abilities required thus include:

— ability to obtain essential medical-social history

- ability to record pertinent information

- ability to establish and maintain effective interaction with a patient
- ability to organize information obtained as a basis for subsequent decision-making.

2. Measuring blood pressure

This widely used procedure in epidemiology, preventive and curative medical care, and rehabilitation involves:

They have been developed for this purpose by Professor A S Elstein. Office of Medical Education Research and Development, Michigan State University, East Lansing, MI, USA, and Dr Lauren M Eyres. Office of Educational Research, College of Human Medicine, Michigan State University, East Lansing, MI, USA.

- obtaining the cooperation of a patient
- making an accurate reading
- assessing the reliability of the reading made
- making an initial interpretation of the results obtained.
 - The abilities required thus include:
- ability to enlist the collaboration of a patient, to make her feel sufficiently relaxed and confident
- —skill in carrying out the set of actions involved in the application of the cuff and the placement of the stethoscope
- ability to read pressure accurately
- ability to interpret and record the reading and judge its accuracy (reliability)
- ability to interpret the results using the standard values provided.

THE PROCEDURES

History-taking

The example given here takes the form of a rating scale to be used by trained observers. A version of this scale has been used satisfactorily in several health care settings. It was adapted by Professor A. S. Elstein and Dr L. M. Eyres from several earlier forms used mainly with nurses in prenatal clinics in the Lansing, MI, area of the USA. The forms were originally designed for evaluating a pregnant woman's health status and not for assessing a health worker's performance in taking a history. The authors added several sections to make the form more appropriate, and the section on history of previous pregnancies was substantially expanded.

The scale is thus an adaptation of several others used in different contexts. Results of studies on its validity and reliability are not yet available. It must be stressed that the scale cannot and should not be used in other settings without adaptation. Other procedures that might be used in addition to the rating scale, but are not presented here, are:

- interview of patient
- the use of patient management problems.

Measuring blood pressure

The procedures are:

- a rating scale
- check by observers of readings made.

Other possible procedures not illustrated are:

- questioning of patient
- oral assessment of description of procedure.

The rating scale is substantially revised and expanded from an examination feedback form initially developed by Dr L. M. Eyres and Dr E. Grandblatt for use in a second-year physical diagnosis course at the College of Human Medicine, Michigan State University. The trainees in this case are medical students learning physical examination skills; their assessors are physicians.

THE RATING FORMS

History-taking

This rating form provides for the assessment of three aspects of performance.

- 1. Was each question on the history form asked? A score of zero (0) means a question was omitted.
- 2. Was the question asked in such a way that the patient could easily understand it? To assess this, the assessor could exercise his or her clinical judgement or, following the examination, the patient could be asked whether certain terms or sentences used by the student examiner were understood by her, or how she understood what was being said to her. A score of one (1) should be given to questions that are poorly phrased.
- 3. If a positive response to a question was obtained, were appropriate additional questions asked to gather pertinent details of the situation? Did the student expand on the subject appropriately when a positive response was obtained? Depending on the quality of this response, a score of 2, 3, or 4 is to be assigned.

Measuring blood pressure

Two components are assessed in evaluating the performance of a student learning to take blood pressure readings: process and outcome.

1. Process: Direct observation of technique and patient interaction

The skilled art of taking blood pressure has been divided into a number of components on the rating form. Some of the components (for example, number 7) are further subdivided. Each component or sub-component is assessed on a 5-point scale in terms of increasing degrees of smoothness and mastery.

If a step is omitted, score 0.

If the basic technique needs review, score 1.

If more practice is needed, score 2.

If technique is adequate for working with patients, score 3.

If technique is smooth and very skilled, score 4.

In short, a score of 3 represents minimal mastery (adequate for patient care) and one of 4 denotes a higher level of achievement.

2. Outcome: Blood pressure reading

Auditory confirmation of the blood pressure recorded by the student can be made by an observer taking a reading and comparing it with that taken by the student.

¹ If the cuff selected is too large, the blood pressure recorded will be erroneously low. If the cuff is too small, the reading will be erroneously high. Written short-answer or multiple-choice questions can be used to evaluate knowledge of this aspect.

² Used to obtain systolic estimate to avoid error from possible auscultatory gap.

Part II EXAMPLES OF ASSESSMENT INSTRUMENTS

EXPLANATORY NOTE

In this part, a number of instruments used in the performance assessment of students and health workers in several countries are presented. They have been kindly made available by their authors and provide useful examples of the techniques described in Part I.

Many of them are still being worked on. They are therefore not to be viewed as instruments which can or should be applied. Rather, they serve to illustrate techniques. It is hoped that their presentation here will serve to stimulate further development and hence improve performance assessment.

The presentation of instruments is not intended to be comprehensive, i.e., to cover most functions or tasks of health workers. Nor is it confined to instruments that have been systematically evaluated. Few of them meet this criterion. Rather, they serve to illustrate different techniques.

It is intended to update this presentation regularly and it is hoped that readers will provide information to WHO so that new techniques and instruments will be made available for inclusion in future publications.

The instruments have been developed to assess the performance of many different categories of health worker or student: nurses; medical assistants (physician's assistants); laboratory technicians; physical therapists; physicians, etc. However, they are not presented by category of health worker, but classified in three sections as follows:

Section 1. Instruments used to assess the performance of essential task elements of most health care action, e.g., data-gathering, effective interaction with other persons, etc.

Section 2. Instruments used in comprehensive assessments of job performance, i.e., designed to cover the whole range of abilities required to carry out the main functions of a specified category of health worker.

Section 3. Instruments to assess the performance of more specific tasks or components of tasks.

Most of the instruments are in the form of check-lists and rating scales. There are, however, examples of techniques using patient management problems or patient simulation, and of questioning of students (oral examinations).

There are few examples of procedures using the more traditional techniques (essay, short-answer tests, multiple-choice questions), though these undoubtedly might form part of a comprehensive assessment of performance.

Some of the instruments are complex, others relatively simple. All of them, however, will need to be used by personnel specially trained to make judgements, observe accurately, etc. Also it cannot be stressed enough that every instrument will need adaptation to ensure its relevance and appropriateness to local conditions.

-51- 77M-110

N80

To assist the reader, each instrument is preceded by a brief explanatory note. In this the following information is presented:

- I. Type of instrument, health care activity involved, and the category of student or health worker for which the instrument was designed or is being used
- II. Competences to be assessed
- III. Specific abilities to be assessed
- IV. Purpose of assessment for which the instrument was developed, including whether it was designed for summative or formative purposes
 - V. Comments (including information on any systematic evaluation that has been carried out and on any special features of the instrument)
- VI. Source, i.e., the name and address of the originator(s) of the instrument for readers wishing to have further information.

Finally, it must be stressed again that the main purpose of this collection of instruments is to stimulate the much needed development of performance assessment techniques. The instruments presented here, by exemplifying what has been done by a few, will—it is hoped—lead to action by many others and will ensure that in the future a whole range of assessment instruments will be at the disposal of teachers and supervisors of health workers.

SECTION 1

CLINICAL PROFICIENCY (GENERAL)

Type of instrument	Performance	Category of health personnel	· ·	Page
Rating scale	Comprehensive clinical proficiency	Medical technologist	1	54

Rating scale	Comprehensive clinical proficiency	Physician	7	73
Rating Scale	Comprehensive clinical proficiency	·	8	76

- I. Rating scale: Comprehensive clinical proficiency (medical technologist)
- II. Competences to be assessed:

Communication

Interpersonal relations

Problem-solving

- III. Specific abilities to be assessed:
 - 1. Ability to execute tests and procedures with efficiency, accuracy, and safety.
 - 2. Ability to organize equipment.
 - 3. Ability to work and communicate easily with patients and colleagues.
 - 4. Ability to record test results neatly and legibly.
- IV. Purpose of assessment: summative.

Used as final examination to assess professional competence of medical technologists.

V. Comments:

No evaluation studies reported.

PROFESSIONAL COMPETENCE

Comments

- I. Rating scale: Comprehensive clinical proficiency (physician's assistant)
- II. Competences to be assessed:

Data-gathering

Data interpretation

Communication

Reporting

- III. Specific abilities to be assessed:
 - 1. Ability to identify patient's problem accurately.
 - 2. Ability to perform diagnostic and therapeutic procedures.
 - 3. Ability to identify, for referral, cases beyond own level of competence.
 - 4. Ability to use and maintain medical records.
 - 5. Ability to work cooperatively with patients and their families as well as with staff.
 - 6. Ability to organize and carry out assignments responsibly and effectively.
- IV. Purpose of assessment: summative.

Designed to be used on completion of training of physician's assistants to assess overall clinical competence.

V. Comments:

Instrument is currently in use in physician's assistant training programme. No formal evaluation or statistical data are available.

PHYSICIAN'S ASSISTANT TRAINING PROGRAM STUDENT CLINICAL EVALUATION

Service assignment	
Dates of assignment	
Dear Doctor	
Please use the following number code when evaluating the	is student's level of ability:
	excellent = 4; Good = 3; Average = 2; Unsatisfactory = 1

Code

- 1. Elicits an accurate and complete patient history.
- 2. Performs an accurate and complete physical examination.
- 3. Accurately identifies the patient's problem.
- 4. Determines action(s) appropriate to the patient's problem, including referral to a physician
- 5. Ability to perform diagnostic and therapeutic procedures.
- 6. Demonstrates knowledge of applicable medical, biological, and physical sciences.
- 7. Utilizes and accurately maintains medical records, as allowed.
- 8. Recognizes own limitations.
- 9. Exhibits ethical behavior and attitudes.
- 10. Maintains professional relations with staff.
- 11. Maintains professional relations with patient and family.
- 12. Communicates ideas and information effectively.
- 13. Plans, organizes, and carries out responsibilities effectively.
- 14. Dress and appearance.
- 15. Attendance and punctuality.
- 16. Acceptance of constructive criticism.

Preceptors are urged to discuss the student's performance and evaluation with them. Please have the student comment on and sign this form before returning it to this program.

Preceptor's comments:

Date

Student's signature

- I. Rating scale: Comprehensive clinical proficiency (physician)
- II. Competences to be assessed:

Data-gathering

Problem-solving

Planning patient management

- III. Specific abilities to be assessed:
 - 1. Ability to obtain essential medical and social history in a sensitive professional manner.
 - 2. Ability to record pertinent information briefly but thoroughly.
 - 3. Ability to organize, interpret, and communicate clinical findings.
 - 4. Ability to select best alternatives among diagnoses and plans for treatment.
- IV. Purpose of assessment: formative.

Intended for periodic use, during a medical course, for rating patient workups.

V. Comments:

The rating form is an adaptation of the Arizona Clinical Interview Rating Scale. No systematic studies available relative to reliability. Provides clear descriptions of behaviour at advanced, acceptable, and unacceptable levels with relation to general but specified areas of competence.

CLINICAL SKILL ASSESSMENT SCALE

Points Criteria

I. Rapport

Explores concerns

- The interviewer seemed alert, sensitive, and responsive to the patient and to possible concerns expressed by the patient regardless of whether such concerns were immediately relevant to the area being discussed, e.g., marital problems, child discipline problems, depression. Interviewer was able to explore concerns in sufficient depth.
- 3 The interviewer was responsive to the patient and able to detect concerns expressed by the patient, but failed to explore them in sufficient depth.
 2
- The interviewer seemed indifferent and was unalert and/or insensitive to possible concerns expressed by the patient. For whatever reason the interviewer tended to avoid discussing possible problem areas which could have either immediate or future implications for the mental or physical health of his patient.

Posture, deportment, dress

- 5 The interviewer's posture, deportment, and dress reflected a sense of professionalism and maturity appropriate to the doctor-patient relationship.
- 3 The interviewer was adequate in his/her posture, deportment, dress.
- The interviewer's posture, deportment, and dress were substandard for his/her role. He/she failed in this area to display adequate professionalism and maturity appropriate to the doctor-patient relationship.

II. Organization

4

2

Covers major areas

- 5 The interviewer progresses through the major subsections of the medical history in proper sequence
- The interviewer covers all of the major subsections of the history but in the wrong sequence.
- 2

The interviewer omits major subsections of the history.

Directs interview

- The interviewer formally directs the interview so that the main purpose is achieved. When necessary, interviewer actively intervenes with tact and appropriate timing rather than "railroading" the patient away from his concerns and priorities.
- The interviewer generally directs the interview but has difficulty maintaining the focus and/or intervening appropriately with more difficult patients.
- The interviewer does not formally direct the interview or attempt to maintain a purposeful focus during the interview.

III. Review of systems

Δ

2

- 5 Asks the right questions and is attentive to the answers. Follows up vague replies with appropriate questions
- 3 Asks the right questions, but often in a mechanical way Rarely misses important information, but tends to follow it up only superficially.
- Omits important questions. Does not follow up important information that he/she does elicit. Is inattentive and often fails to listen carefully to answers. Frequently fails to use information from the review of systems in formulating and analysing the patient's problems.

IV. Written material

Brevity, pertinence

- 5 Case write-ups are brief, yet important and pertinent data are not emitted.
- 3 Case write-ups are acceptable, however brevity/pertinence (circle one or both) need(s) improvement 2
- 1 Case write ups are awkward. Sentence structure is unwieldy. Student fails to extrapolate important data

V. Verbal presentations

Concise, well organized Gives clear picture of patients and their problems. Shows poise Accepts criticism well and makes use of it.

4

V. Verbal presentations (contd.)

3 Somewhat longer than necessary, but well organized and informative. Somewhat ill at ease and mechanical in his/her presentation, but responds well to questions and criticism.

Rambling, disorganized presentations. Student excessively nervous. Thinks poorly when asked questions in the course of the presentation. Resentful of criticism.

VI. Clinical reasoning and judgement

2

4

4

2

2

2

Ability to identify problems

5 Defines problems accurately and shows good judgement in determining their order of importance. Problem lists are complete, with appropriate emphasis on each problem.

Defines the most important problems, but lacks consistency in assigning them appropriate priorities. Problem lists sometimes incomplete, but rarely omits major problems.

Frequently omits major problems. Problems are poorly defined, indicating a poor understanding of the clinical information. Poor sense of priority in his/her approach to multiple problems.

Ability to organize, distil, and analyse clinical data

5 Is meticulous and accurate in assembling clinical information and condensing it. Organizes the information clearly and concisely, and has a good sense of how to relate the information to the patient's problems.

3 Assembles clinical information accurately and thoroughly. Inconsistent in his/her ability to relate clinical information to the patient's problems.

Clinical information is frequently inaccurate or incomplete. Fails to organize facts in a logical way. Frequently reaches conclusions that are not based on available information.

Ability to formulate working hypotheses based on clinical data

5 Shows sound reasoning in drawing conclusions from available clinical data. When he/she does speculate, he/she is aware of it and says so. Shows appropriate scepticism toward his /her working hypothesis and a willingness to change it as additional data dictate.

Shows sound reasoning in drawing conclusions from additional data, but tends to state conclusions without indicating how he/she arrived at them. Seldom reaches conclusions that are not justified by the data. Is usually willing to change his/her interpretation if new data warrant it.

Often confused about the meaning of clinical information and draws illogical conclusions from it. Does not distinguish well between conclusions based on available information and conclusions based on speculation. Adheres too rigidly to his/her conclusions even when available evidence shows them to be wrong.

Ability to make plans for diagnosis, treatment, and patient education

5 Plans are thoroughly considered and appropriate.

3 Always puts forward plans and they are usually appropriate. However, they are often sketchy and poorly defined.

Often fails to put a plan forward. When he/she does, it is poorly organized and frequently irrelevant to the patient's problems.

Ability to consider logical alternatives

Gives thorough consideration to alternative interpretations to those he/she puts forward. The alternatives are realistic explanations for the particular problem at hand. Is appropriately flexible in altering his/her conclusions in light of new information, but is not easily swayed by inconclusive data or by the opinions and speculation of others.

3 Consistently arrives at logical conclusions, but keeps an open mind about logical alternatives. Usually considers the most likely alternatives, rarely suggests impossible ones, but does tend to omit uncommon possibilities.

Prone to develop "tunnel vision" about a problem and often fails to acknowledge possible explanations other than the one he/she favors. Adheres rigidly to his/her conclusions even in the light of information which shows them to be wrong. Shows little interest in alternative solutions to a problem.

- I. Rating scale: Comprehensive clinical proficiency (physician—postgraduate)
- II. Competences to be assessed:

Data-gathering

Recording

Interpreting

Communicating

Planning patient care

- III. Specific abilities to be assessed:
 - 1. Ability to take comprehensive history and perform accurate physical examination.

2. Ability to report cases clearly and accurately.

- 3. Ability to manage patient care constructively and independently.
- 4. Ability to work smoothly and effectively in interpersonal relationships.
- 5. Ability to apply scientific data to the solution of health problems.
- IV. Purpose of assessment: summative.

Used in rotation programme to assess overall clinical competence at the end of each service—medical postgraduate (interns, residents, fellows).

V. Comments:

Instrument has been evaluated and statistical data are available on reliability, as well as predictive analysis studies. Has useful discussion of common rating errors to be avoided.

POSTGRADUATE TRAINEE RATING FORM FORM H INSTRUCTIONS

PLEASE READ THESE INSTRUCTIONS BEFORE COMPLETING THE RATING FORM:

On this form you will find a number of traits which have been identified as describing characteristics of professional trainees (interns, residents, and fellows) which are important components of professional competence.

Each of these traits is to be rated on a continuum which has two opposite poles with different "degrees" of the trait in between poles. Along the continuum are short descriptive phrases (anchors) which describe different degrees or amounts of a particular trait. These phrases are simple guideposts.

To record your rating, simply check(y) the line at the point which in your best judgment describes the professional trainee on a particular trait. Your ratings can fall at the anchor or anywhere between anchors. In general, the finer your discrimination of a trainee's performance on a particular trait, the more accurate your rating will be.

Your rating should reflect the trainee's performance with respect to the standard for his group and training level and in accord with the anchors which describe performance.

If you feel that you have not had sufficient opportunity to evaluate a trainee on a particular trait, indicate "NOT OBSERVED" by placing a check (\lor) in the box adjacent to the trait.

CAUTION!

The following are common rating errors which will tend to make your ratings less reliable. Please be conscious of your own tendency to make these errors as you complete the ratings. Be as precise and objective as possible.

COMMON RATING ERRORS:

- 1. Error of Leniency. Raters tend to rate those whom they know well or like higher than they should.
- 2. Error of Central Tendency. Raters hesitate to give extreme judgments and thus tend to displace very high or very low ratings in the direction of the mean of a group.
- 3. <u>Halo effect</u>. Raters tend to make judgments on one trait on the basis of their feelings about other characteristics of the trainee. For example, your feelings about a trainee's appearance may color your views of his diagnostic ability.
- 4. Logical Error. Raters tend to give similar ratings for traits that seem logically related in the mind of the rater. For example, there may be a tendency to give similar ratings on diagnostic ability and oral verbal ability when this is not justified.
- 5. Proximity Error. Raters tend to give similar ratings on traits which are adjacent to one another in the rating form.
- 6. Contrast Error. Raters tend to rate individuals in the opposite direction from the rater's perception of his own ability on a given trait. For example, if a rater sees himself as having an extremely high level of intellectual curiosity, he will tend to rate others lower on this trait than most other raters.

Physician Assistant Program

The George Washington University Medical Center

Washington, DC

USA

CASE PROBLEM

Mary Ellen E is a twelve-year-old student who comes to the physician's office because of a persistent sore throat. About a week ago she began having a sore throat, mild fever and chills, headache, fatigue, and general malaise. The fever, which she didn't measure, seems to have subsided for the most part, as has the headache, but the sore throat and the fatigue have continued without improvement. Her sleep has been restless and her appetite poor.

- 1. At this point, what additional questions would you like to ask on history?
- any respiratory symptoms: cough, cold, runny nose, sputum production
- _any gastrointestinal symptoms: nausea, vomiting, diarrhea
- _any past history of sore throat, "strep" throat, rheumatic fever, mononucleosis
- any other significant past medical history, medication, immunization history
- _questions to define "fatigue"—how much, relation to activities, any history of anemia
- _aggravating or relieving factors, treatments tried, effect of illness upon patient
- _known exposure to others with similar symptoms: are any other family members ill?

(Possible points: 7)

(Student gives in page 1 before getting page 2.)

(Page 2)

On further questioning you learn that she has no other noticeable symptoms, no significant past or present medical problems, and no known exposure to others with similar symptoms. No one else in the family is ill. She has been staying home from school and has been too tired to do much more than watch TV. Immunizations are complete. On physical exam you find the following:

T - 101.2 F. P - 84, req. BP - 116/78

General: The patient is a slightly overweight white female; no acute distress.

Skin. Few acneiform lesions on the face. Also questionable faint maculopapular rash on chest and upper

EENT: Eyes, ears, nose-within normal limits. No nasal discharge. Oropharynx is markedly injected with

low-grade lymphoid hyperplasia; tonsils are 2 + in size, hyperemic, and have a grayish exudate

bilaterally

Neck Moderately enlarged, tender cervical adenopathy bilaterally involving the anterior and posterior

triangles. Thyroid not enlarged.

Chest: Clear to percussion and auscultation. Bilateral fine axillary adenopathy, non-tender. Heart

Grade II/VI systolic ejection murmur at apex radiating to axilla. (Patient tells you she has been told by

other physicians about this.)

Abdomen Liver 6 cm by percussion, edge palpable and slightly tender at costal margin. Spleen palpable 3 cm

below costal margin and is moderately tender. No abdominal distention or masses. Normal bowel

sounds. Bilateral inguinal adenopathy—firm, small, non-tender.

Extremities: Within normal limits.

2. What is your differential diagnosis at this point?

1 point each for: mononucleosis, streptococcal pharyngitis, viral pharyngitis, acute leukemia

extra credit point for cytomegalovirus mononucleosis.

No points, but not wrong for: diphtheria, rubella, hepatitis, rheumatic fever, juvenile rheumatoid arthritis.

(Possible points: 4)

3. What laboratory tests would you want to order?

1 point each for complete blood count (CBC) or white blood cells (WBC), throat culture, heterophil antibody test (or Monospot).

No credit but not wrong for liver function studies.

Epstein-Barr virus-specific serodiagnostic test is wrong answer here (too expensive and not necessary)

(Possible points: 3)

(Give in page 2 before getting page 3.)

(Page 3)

You order a throat culture, CBC, liver function studies, and heterophil antibody test. In one hour you have the following results

- (1) Hemoglobin (Hgb) -13.2 g/100 ml Hematocrit (Hct) -40% 30% neutrophils, 3% eosinophils, 1% basophils, 10% monocytes, 56% lymphocytes WBC-13000 Approx. 15% of the lymphocytes are atypical forms.
- (2) Heterophil antibody test-weakly positive.
- 3. What is your diagnosis at this point? (Correct answer: Infectious mononucleosis)

(5 points)

 4. What would you do now? (a) hospitalize the patient for workup, (b) reassure patient that her disease is benigh and send her home for rest and observation, or (c) give antibiotics and await results of throat culture. 	
(Correct answer: (b))	
(2 points)	
(Give in page 3 before getting page 4)	
(Page 4) The next day you get the following reports: Throat culture negative at 24 hours. SGOT—75 units/ml (normal 5-40) SGPT—60 units/ml (normal 5-35) Alk. phos.—6.2 Bodansky units (normal 2.0-4.5)	
bilirubin (total) —1.4 mg% (normal 0.2–0.9) 5. Would you change your previous diagnosis or management in the light of these results? If so, explain why. (Correct answer: No)	
(2 points)	
(Give in page 4 before getting page 5)	
(page 5)	
You talk to your preceptor, who concurs with your initial impression of infectious mononucleosis. Transient elevation fliver function studies occur in 90% of patients with mononucleosis and will return to normal with recovery.	or
6. What special precautions, if any, should patients with mononucleosis take? (Correct answer: Avoid abdominal trauma (ruptured spleen))	
(2 points)	
(Total possible points: 25) ~	

- I. Rating scale: Comprehensive nursing proficiency
- II. Competences to be assessed:

Data-gathering

Patient care management

Patient education

Communication

III. Specific abilities to be assessed:

- 1. Ability to base nursing practice on a process of assessment, planning, implementation, and evaluation.
- 2. Ability to direct and carry out the elements of a patient care programme.
- 3. Willingness to participate in activities to increase skills and knowledge.
- 4. Responsibility, as evidenced by pursuit of own professional goals and adherence to institutional policy.
- 5. Ability to plan, carry out, and evaluate teaching.
- 6. Ability to exchange information with peers and patients effectively.
- IV. Purpose of assessment: formative.

Used to assess general nursing proficiency and to correct problem areas in POR [problem-oriented research] documentation. Used periodically.

V. Comments:

Instrument has been evaluated informally in that it has been used in several clinical areas and results compared.

REGISTERED NURSE PERFORMANCE EVALUATION

	Name: Class: — Date:			
	Unit:			
1. Nursing practice—the process of assessment, planning	ig, implementation, and evaluation as a basi	is for	practi	ICE
 A. Assessment: 1. Collects pertinent data to identify patient strengths (a) patient interviews (b) interviews with family and or other key person (c) medical record (d) collaboration with other health team members (e) clinical observation and examination 2. Identifies nursing care problems on the basis of the Comments: 	es	rarely	frequently	
				ı
B. Planning (participates in developing, or develops, th	e nursing care plan):			
 Determines appropriate nursing interventions inclu Determines priorities of care. Writes out the care plan in clear and measurable te Determines that the individual plan of care is consisted is congruent with other planned therapies. Includes discharge plans and goals in the nursing Mobilizes equipment and resources necessary for surplan. Involves the patient and/or other key persons in plan. Involves the patient and/or other key persons in plan. Demonstrates the clinical skills necessary to carry or c	ding preventive nursing measures. erms. ent with the standard nursing care plan and care plan. ccessful implementation of the nursing care lanning care when appropriate. out the nursing interventions.			
5. Utilizes opportunities to teach health care concept6. Follows up the nursing care plan developed.	s to the patient and/or other key persons.			
Comments:				
 D. Evaluation: 1. Routinely evaluates the effects of the nursing care (a) Assesses the patient's progress toward health (b) Assesses the acceptance by the patient and/or (c) Assesses the patient's comprehension of the parequired. 2. Revises care plan when necessary, utilizing current (a) Is willing to test new nursing care techniques (b) Utilizes information from other health team me (c) Initiates consultation when appropriate. Comments: 	or highest level of functioning. other key persons of the care delivered articular health care problem and the care to data. and methodologies.			
II. Management skills—those organizational skills necess entation of the appropriate components of a patient care	sary for the efficient direction and implem- delivery system for a particular unit area.			
A. Assessment of organizational needs:	o and allocated recourses			

Anticipates potential work-flow problems.
 Identifies available and potential resources.

5. Identifies alternate actions.6. Implements appropriate actions.

4. Identifies actions necessary to accomplish work tasks.

B. Direction of others:	1	1	i
Directs the activities of designated staff.			ı
2 Sets priorities for the completion of work tasks and delegates responsibilities among available		frequently	Ш
qualified staff. 3. Sees that work tasks are completed.	<u>></u>	1ne	ŀ
5. Sees that work tasks are completed.	rarely	frec	
C. Evaluation of unit operation:			П
Evaluates the performance of designated staff.			ш
Takes appropriate action to correct unacceptable practices of designated staff.			Ш
3. Contributes to the efficiency of the area/unit, e.g., by offering suggestions for change,			
improvement in methods of organization or delivery of care, greater flexibility.			Ш
Comments:			
III Professional education and self-development—participation in formal and informal learning			
opportunities to increase skills and knowledge.			
A. Attends staff development and in-service programs:			
1. Recommended for all unit staff.			П
2. Other programs.			ш
B. Attends continuing education programs.			
C. Reads literature pertaining to area of practice.			Ш
D. Plans for own continued learning through participation in a variety of activities.			
E. Implements in practice setting knowledge and skills gained (list examples in space below)			П
F. Participates in activities to share expertise (list examples in space below).			
Comments:			
IV. Responsibility—adherence to policies and procedures and assumption of initiative for improving			
personal and institutional practices.			
A. Adherence to policies and procedures:			
Adheres to institutional, departmental, and unit policies and procedures.			
2. Identifies improvements in policy and initiates policy changes through appropriate			
mechanisms.			
8. Personal practice:			
1. Uses unstructured time constructively.			
2. Identifies deficiencies in personal performance; takes action to correct his/her errors; seeks			
appropriate resources to improve his/her practice.			
Maintains confidentiality and privacy of recipients of services. Establishes professional goals and pursues and assemblishes them within passarable time.			
 Establishes professional goals and pursues and accomplishes them within reasonable time limits. 			
Comments:			
V. Teaching—the process of imparting knowledge to improve comprehension, skills, and sensitivity.			
A. Assessment:			
Assesses the need for information. Assesses the degree and level of information needed.		- 1	
Assesses the degree and level of information needed. Assesses the level of understanding.			
4. Assesses the readiness of the learner to utilize information.			
B. Objective formulation:			
1. Identifies the goals to be obtained through teaching.			
2. Seeks to incorporate the goals of the learner in teaching.3. Sets realistic goals with the learner.			
C. Program planning:			
Designs teaching plans. Sets realistic time limits for accomplishment.			
3. Conveys plans in clear, workable manner and records them appropriately.			
4. Contacts appropriate resource personnel for assistance.			
5. Plans method of evaluation.			

D. Implementation:1. Follows through with planned program.2. Conveys information clearly.

V. Teaching (contd.)

E. Evaluation:			1
Uses feedback to appraise effectiveness of teaching.		_	1 =
2. Adjusts plan appropriately to input and feedback.		ant.	ste
Adjusts plan as necessary to meet changing needs.	arely	requently	consistently
Comments:	ran	fre	00
VI. Communication—the process of information exchange.			
A. Written:			
1. Maintains patient records which are:			
(a) complete and concise,			
(b) legible,			
(c) completed in a timely fashion.			
2. Maintains non-patient records which are complete, concise, and timely.			
B. Verbal:			
1. Communicates with peers in a concise, tactful, and considerate manner.			
2. Communicates with other hospital staff in a concise, tactful, and considerate manner.			
3. Communicates with patients, families, and the public in a concise, tactful, and considerate manner.			
C. Interpersonal relations (self-awareness):	1		
1. Identifies own feelings and attitudes.			
2. Recognizes the effect of personal feelings and attitudes on performance.			
3. Seeks counsel and support from appropriate persons in the event of feelings interfering with performance.			
D. Relationships with others:			
1. Listens carefully and objectively to others.			
2. Responds appropriately to constructive suggestions.			
3. Promotes and demonstrates cooperative relationships with hospital staff, patients, and the			
public.

ASSESSMENT INSTRUMENT 7

- I. Rating scale: Comprehensive clinical proficiency (physician)
- II. Competences to be assessed:

Data-gathering

Recording

Interpreting

Planning patient care

Communication

III. Specific abilities to be assessed:

- 1. Ability to take essential history and perform appropriate physical, social, and mental status examination.
- 2. Ability to record pertinent patient data in a concise, organized manner.
- 3. Ability to plan and manage patient care logically and capably.
- 4. Ability to request and interpret appropriate laboratory procedures.
- 5. Ability to work responsibly and cooperatively with patient and members of health care team.
- 6. Ability to identify patient problems that should be referred to a specialist.
- IV. Purpose of assessment: summative.

Used at end of a period of service in the training of a medical student, intern, or resident.

V. Comments:

This is a revised version, upon which further research is being done. Instrument has been evaluated and reliability found low.

VI. Source to contact for further information:

ASSESSMENT INSTRUMENT 8

- I. Rating scale: Comprehensive clinical proficiency (physician)
- II. Competences to be assessed:

Data-gathering

Problem-solving

Communication

Treatment-planning

- III. Specific abilities assessed:
 - 1. Ability to elicit significant medical, family, and social history.
 - 2. Ability to obtain data needed for differential diagnosis.
 - 3. Ability to plan appropriate therapeutic programme.
 - 4. Skill in employing medical tests and procedures.
 - 5. Ability to record and communicate data briefly but thoroughly.
 - 6. Ability to interact effectively with patients and colleagues.
- IV. Purpose of assessment: formative.

Intended for use in periodic review of growth in professional capabilities of medical student.

V. Comments:

Instrument has been evaluated statistically and data are available.

ASSESSMENT INSTRUMENT 9

- I. Check-list: Diagnostic clinical examination (physician)
- II. Competences to be assessed:

Gathering, interpreting, and recording data

Communication

- III. Specific abilities to be assessed:
 - 1. Ability to obtain relevant medical, social, and psychological histories and record them accurately.
 - 2. Ability to carry out and interpret physical and neurological tests and procedures and record them correctly.
 - 3. Ability to communicate clearly.
- IV. Purpose of assessment: summative.

Following a course designed to provide experience in clinical performance, or periodically during an internship.

V. Comments:

Instrument has been pilot-tested with various groups, revised, and various studies of rater reliability have been completed.

VI. Source to contact for further information:

ASSESSMENT INSTRUMENT 10

- I. Patient management problem: Diagnosis and management (physician
- II. Competences to be assessed:

Data interpretation

Diagnosis

Treatment-planning

Patient education

- III. Specific abilities to be assessed:
 - 1. Ability to diagnose a health problem correctly, given case history and examination data.
 - 2. Ability to identify the essential problems in a case.
 - 3. Ability to develop appropriate plans for treatment and patient education.
- IV. Purpose of assessment: summative.

Test has been used as a comprehensive examination at the end of a sequence of courses in the third year of medical school.

V. Comments:

Instrument has been evaluated by both faculty and students by means of written feedback reactions. No statistical data are available, however.

VI. Source to contact for further information:

PATIENT MANAGEMENT PROBLEM

Note for students

In the morning, the student will read a short case history and physical examination data from which he/she is to develop (a) an initial problem list that includes a differential diagnosis for each problem, (b) an assessment of the situation, (c) an appropriate diagnostic plan, treatment plan, and patient education plan. This should take approximately 30 minutes. The examiner and student will meet together and the examiner will allow the student to proceed with his/her diagnostic plan. He/she will give the student results from requested laboratory tests. In addition, the examiner will question the student's approach and guide the student into the right general area by asking pertinent questions. At the completion of this session, the examiner will give all remaining data to the student which he/she has not asked for but which is considered appropriate or necessary for the diagnosis and treatment of the patient. The session will take one hour.

On the next morning, the areas mentioned above are covered with the student, as well as the references utilized by the student in working on the problem. More credit should be given for references from current journals than for those from textbooks. The student should (a) present written progress notes on each identified problem in SOAP¹ format, (b) be prepared to give an oral explanation of the disease processes involved and justification for diagnosis and treatment, (c) prepare a bibliography of not less than 5 or more than 15 of the most pertinent references, including consultants. The student may bring reference material to the examination including articles, textbooks, reports from consultants, or other written materials he or others have prepared. The examiner will be the same for both days for a given student working on a specific problem. The instructor will read the student's progress notes and bibliography and orally examine the student regarding his progress notes, bibliography, understanding, logic, and problem-solving abilities.

The student will discuss the case with a physician-examiner for approximately one hour, and will be able to seek additional data from him/her as well. The student will have the afternoon and evening to pursue the patient management problems using any and all available resources i.e., books, journals, consultants, fellow students, etc. On the next morning, he/she will spend one hour with the examiner discussing the case.

The forms that will be used to evaluate performance on the patient management problem are attached. Exceptional = 5, good = 3, adequate = 2, marginal = 1, unacceptable = 0, not evaluated = omit. The minimum passing level for the patient management problem is:

- (1) a maximum of two marginal ratings and at least an adequate rating for both days;² and
- (2) a minimum mean value of 1.75 for
 - (a) all 9 ratings for the first day,
 - (b) all 10 ratings for the second day.

 $^{^{1}}$ S = subjective; O = objective; A = assessment; P = plans.

² Any one rating of "unacceptable" indicates failure.

Comments (required):

PROBLEM NO. 7

Name: M.K.—123 Address: Wagner, SD Age: 15 years Sex: Female Civil state: Single Occupation: Student Race: White Admitted: 12/75 (Yankton)

This young teenager presented with:

Chief complaint: Headaches, nausea, vomiting-2 months' duration.

Informants: Mother plus patient—both appeared reliable.

Present illness. The patient was apparently well until 2 months prior to admission when the patient developed headaches, usually in the right or left frontal area, pounding in character, lasting 3-4 hours, occurring 3-4 times per week and associated with nausea and vomiting. The headaches may occur at any time of the day. There is no numbness or weakness on either side associated with the headaches.

The patient has had some nose bleeds the preceeding summer.

Medication: None

Family, developmental-social history: Patient has a sister who has one hip socket missing and also has had some form

of kidney problem-type unknown. Otherwise negative.

Past history: The mother relates that her daughter has a history of frequent urinary tract infections, but her daughter is not a complainer and would not complain unless the infections were really bad. The patient was hospitalized for 10 days for urinary tract infection at another institution 2 years ago. No X-ray studies were performed and laboratory values were unknown.

Review of systems: Non-contributory except for:

1. Lack of energy for the past 5-6 months

2. Menarche—age 13 years—regular cycle

Physical examination: height 64½ inches (25–50 percentile); weight 114 pounds (25–50 percentile); heart rate 18; pulse 72; temperature 98.6° (oral); blood pressure 188/120 right arm lying, 170/120 left arm lying, 200/130 right leg lying, 190/130 left leg lying.

The patient is a 15-year-old white female who is well developed, well nourished and in no acute distress. She is

oriented to time, place and person and is pleasant and cooperative.

Head: Normocephalic without bruits.

EENT: Ear canals are clear; tympanic membranes normal color and intact. Dental hygiene good. Throat showed no inflammation or lesions. Sclerae-conjunctivae clear. Extraocular movements normal without nystagmus. Pupils, round, regular, equal, react to light. Funduscopic—normal.

Chest: Breasts: Early prepubertal

Lungs: Clear to auscultation and palpation, percussion.

Cardiac: Rate is regular. Grade I/VI systolic murmur along left sternal border at 2nd left interspace with radiation into left carotid

Abdomen: Soft, tympanitic with active bowel sounds. No organomegaly or other masses. Femoral pulses are full and equal bilaterally.

Genitourinary: Externally normal female.

Rectal: Not done.

Extremities: Full range of motion without deformities.

Neurological: Cranial nerves I-XII were intact. Muscle strength and tone good in upper and lower extremities. Abduction, adduction, internal and external rotation, extension and flexion good.

Reflexes: Biceps, triceps, brachial radialis, patellas, Achilles are 2-3 + bilaterally. Plantar reflexes were downgoing bilaterally.

Gait and coordination: Intact to rapid alternating movements in the upper and lower extremities. Finger to nose was done bilaterally without difficulty and the patient was able to draw a triangle without difficulty with her foot. Gait: normal (toe, heel, tandem, ordinary gait). Romberg: negative.

Admission-complete blood count (CBC) + urinalysis

CBC Hemoglobin (Hgb) 8.4 g/100 ml

Hematocrit (Hct) 26%

White blood cells (WBC)-4900 with 2% bands, 52% segments, 1% basophils, 1% eosinophils,

42% lymphocytes, and 2% monocytes.

Urine pH 6.0

Specific gravity 1.014

Albumin 3 + Sugar $\overline{0}$ Acetone $\overline{0}$

WBC 1-2/high power field (hpf)
Red blood cells (RBC) 15-20/hpf

No crystals or casts

PATIENT MANAGEMENT PROBLEM

(FOR EXAMINER ONLY)

Patient: M K.-123

Screening lab. data in addition to complete blood count and urinalysis.

Nà 137, K 4.8, Cl 105, *CO, content 14, pH 7.35

Profile. *Ca 8 6, *P 6 9, glucose 120, *blood urea nitrogen (BUN) 58, uric acid 7 5, cholesterol 245, total serum protein 6.5, albumin 3.7, total bilirubin 0.5, *Alk. phosphatase 125, LDH 260, SGOT 20

* Abnormal

Essential problems:

- 1. Hypertension (with headaches, nausea, vomiting)
 - a. Proteinuria
 - b. Hematuria, microscopic
 - c. Azotemia
- 2. Chronic renal disease
- d. Hypocalcemia, mild
- e. Hyperphosphatemia
- f. Acidosis (low CO₂ content, borderline low pH)
- g. Anemia
- 3. Urinary tract infection—past history

If the student does not have the profile prior to being asked the problem list then the essential problems would be

- 1. Hypertension (with headaches, nausea, vomiting)
- 2. Anemia
- 3. Proteinuria
- 4. Hematuria, microscopic
- 5. Urinary tract infection, past history of

Eventually the student should arrive at a diagnosis which should essentially be

- 1. Reflux nephropathy, bilateral
- 2. Chronic renal disease, with associated:
 - a. hypertension
 - b. secondary hyperparathyroidism
 - c. anemia
 - d. acidosis
 - e. azotemia
 - f. proteinuria and hematuria
 - g. infection

Essential problems

1. Hypertension—The student has received information via lectures that hypertension in a teenager in general falls into 2 groups. Essential for white males, black males, and females. Secondary, white females. Therefore, he should quickly decide that the hypertension is secondary to some underlying disease process and most likely will pick renal artery stenosis as the first option, though in actuality with the anemia, proteinuria, and hematuria available from the initial labilitation, the student should rather say. Chronic renal disease—7etiology—perhaps glomerulo-nephritis or pyelonephritis.

The student may however start off with a differential diagnosis of hypertension which would probably include the following:

- 1. Coarctation of aorta—Ruled out by lower extremity blood pressure.
- 2. Pheochromocytoma—No lab. studies were done—since renal disease was found
- 3. Hyperthyroidism—No clinical evidence. No lab. studies done.
- 4. Hyperaldosteronism-No alkalosis or hypokalemia.
- 5. Brain tumor-No projectile vomiting, no papilledema.
- 6 Renal artery stenosis. No abdominal bruits. Peripheral blood renin levels. 5 hours post-Lasix (furosemide) = 0.4 ng ml h (normal = 0.4—4.5 ng ml h).

7. Chronic renal disease

a. Glomerulonephritis-red blood cells in urine

Necessary lab data Intravenous pyelography (IVP) (available for student interpretation) Interpretation Bilateral function with slow uptake, kidneys equal in size, both small, suggesting bilateral renal disease, possibly chronic glomerulonephritis.

b. Pyelonephritis-Small kidneys on IVP

Necessary lab. data: Urine culture—negative

c. Reflux nephropathy

Necessary lab data. Voiding cystourethrogram (available for student interpretation)—Bilateral ureterorenal reflux on voiding.

Consultation May consult radiologist regarding X-rays. May consult nephrologist regarding reflux nephropathy versus pyelonephritis. May consult *Kidney International*, Supplement 4, August 1975, for a discussion of reflux nephropathy.

Initial Treatment: May select any of a variety of antihypertensive agents, for which the student should know site of action, onset of action, dose, contraindications, and reactions.

Thiazides Renin stimulating by virtue of decreasing plasma volume works in distal tubule loop of Henle. Onset of action—1 hour (oral). Dose: 50 mg/m²/day orally in 2 divided doses. Contraindications: Renin type hypertension. Reactions: Primarily hematopoietic, plus alkalosis, hypokalemia, etc.

Reserpine Renin-inhibitor. Action at nerve ending—depletes catecholamine stores. Onset of action—3-4 days (oral), 3-4 hours (IM). Dose: 0.1-0.2 mg twice daily to start. Contraindication: Peptic ulcer, mental depression. Reactions: Nasal obstruction, diarrhea, nightmares, depression.

Alpha-methyl DOPA - Renin-inhibitor—Inhibits catecholamine synthesis. Onset of action—2 hours (oral, IV). Dose: 10 mg/kg/day in 2-3 divided doses (oral), 20–40 mg/kg/day in 2-4 divided doses (IV). Reactions: Postural hypotension, hepatitis and hemolytic anemia, drug fever.

Hydralazine Dilatation of arterioles and decreased peripheral resistance—acts on arterioles. Onset: 3 hours (oral) 10–20 minutes (IV). Dose: 0.75 mg/kg/24 hours in 4 doses (oral), 1.7–3.5 mg/kg/24 hours in 4–6 divided doses (IV). Reactions: tachycardia, palpitation, headache, diarrhea, lupus syndrome.

In the patient under discussion 2 drugs were used: hydrochlorothiazide 25 mg twice daily orally plus reserpine 0.2 mg twice daily orally with BP control at about 130–140/80.

2. Chronic renal disease

a. Proteinuria

Necessary lab.: Repeat urinalysis revealed 3-4 × proteinuria. 24-hour urine protein not done.

- b. Hematuria—microscopic—persistent 8-10 red blood cells/high power field
- c. Azotemia

Necessary lab.: Repeat BUN 35, 58

Creatinine clearance = 11.3 ml/min (Serum creatinine = 3.3 mg%)

- d. Hypocalcemia, mild
- e. Hyperphosphatemia—Repeat 7.2
- f. Acidosis Repeat CO2 content = 16 meq/L, pH 7.38
- g. Anemia

Necessary lab.: Retic count 1.9%. Direct Coomb's negative. Indirect Coomb's negative. Red cell indices: mean cell volume 81 (87–97), mean cell hemoglobin content 35.5% (31–35), mean cell hemoglobin 28 (28–31), repeat hematocrit 24%.

3. Urinary tract infection— past history

Necessary lab.: Repeat urine culture-100 000 Escherichia coli.

The student should reach the diagnosis as noted above.

The treatment of the chronic renal disease with the associated problems should be:

- a. Hypertension as noted above.
- b. Secondary hyperparathyroidism
 - (a) Amphojel (aluminum hydroxide gel)—To block phosphate absorption. Dose will vary—started at 600 mg three times a day.

Follow-up reveals P of 5.7 (2 months post-hospital).

- c. Anemia—no therapy. The use of FeSO₄ is not indicated—no iron deficiency; rather hemolysis plus poor marrow
- d Acidosis-Use of NaHCO, started at 1200 mg three times a day. Follow-up CO, 27 meg L
- e. Azotemia 20 g protein diet
- f. Proteinuria + hematuria-No treatment.

The reflux nephropathy might be handled:

(a) Surgically with reimplantation

Consultant-urologist Actually we decided on 6 months conservative medical management

- (b) Medical: (1) Treat infections
 - (2) Double to triple voiding
 - (3) Follow biochemical lab. values.
- g. Urinary tract infection
 - (a) Treatment—ampicillin—bacteria sensitive to this drug which is not contraindicated in the face of chronic renal failure.

TM-110

Patient family education revolves around the problem of chronic renal disease with hypertension and failure. The areas that must be stressed are:

- 1. Control of the hypertension—hypertension itself can intensify the renal disease and failure.
- 2. Dietary management to alleviate or prevent as far as possible the effects of uremia.
- 3. Amphojel to prevent or control the bone effect of secondary hyperparathyroidism. Later Vitamin D or one of its metabolites may need to be added to the regimen.
- 4. Bicarbonate use to provide body with buffer so metabolism is normal.
- 5. The fact that the child has chronic renal failure and that our therapy is directed toward aiding the kidneys to maintain as far as possible body homeostasis, but that this therapy will not reverse the disease process.
- 6. Control of urinary tract infection because of the easy accessibility to the kidneys as a consequence of the bilateral reflux.
- 7. The possible use of surgery to stop the reflux, but the possibility that it may not or that ureteral obstruction could occur post-operatively. Further that is unlikely to reverse the process.
- 8. The strong likelihood of dialysis and renal transplantation in the future—estimated as the time when the creatinine clearance is 5 ml min 1.73 m².

ASSESSMENT INSTRUMENT 11

- I. Check-list: History-taking and physical examination (physician's assistant)
- II. Competence to be assessed: Data-gathering
- III. Specific ability to be assessed:

 Ability to elicit comprehensive medical-social history.
- IV. Purpose of assessment:

 Used as a mid-term evaluation in a course in medical history-taking for physician's assistants.
 - V. Comments:

 Totally concerned with data or content, and not with technique.

 Criteria are simply P (present) or, if any of the listed points are omitted, A (absent). No evaluation data are available.

- I. Rating scale: Interviewing skills (physician's assistant)
- II. Competences to be assessed:

History-taking Communication

- III. Specific abilities to be assessed:
 - 1. Ability to establish rapport with patient.
 - 2. Ability to elicit and recognize pertinent information.
 - 3. Ability to summarize and clarify responses.
 - 4. Ability to project sincerity and professional consideration for patient as regards confidentiality.
 - 5. Ability to interpret and report patients' non-verbal behaviour.
- IV. Purpose of assessment: formative or summative.

Designed to explore student's mastery of the process of interviewing. Observer not expected to assess the subject of the questioning so much as the ease and style with which it is carried out. Could be used for pre-test, periodic assessment, or end-of-course assessment.

V. Comments:

Scoring is simply "satisfactory", "unsatisfactory", or "cannot rate". Criteria for the first two variables are provided for ten areas of interviewing performance. No evaluation data are available. Has been used in physician's-assistant programme.

VI. Source to contact for further information:

Martha Duhamel MEDEX Northwest University of Washington Seattle, WA USA

INTERVIEW CRITIQUE SHEET

Directions: Anchor-point criteria are provided for each variable on a continuum from "satisfactory" (S) to "unsatisfactory" (U). Each student should be judged on every variable and a check () placed in the box which indicates the student's performance on the continuum. If you cannot rate a student on a variable, check the right-hand column.

	Date	1- 1
Observer (self or other)		Jour
SATISFACTORY (S) CRITERIA 1. Opening remarks Greets patient by name, with appropriate social gestures (handshakes, etc.). Introduces self; explains purpose of interview. Time frame explained, and patient's consent obtained. Sufficient time spent to establish rapport. Attention paid to both comfort and privacy of patient and interviewer. Comments:	Brusque introduction. Insufficient time spent on social amenities. Unclear introduction and explanation of purpose of interview. Insensitive to patient's anxiety or need for comfort and privacy. Authoritarian rather than collaborative role as-	Cannor
2. Non-verbal communication: Interviewer demonstrates an interest in what the patient is saying by eye contact, leaning forward, encouraging looks, and nodding (where appropriate). Comments:	patient; or stands up prematurely, cutting off	
S	U	2
3. Questioning skills, types: Questions are simple and brief. Asks openended questions and progresses to focused and closed questions only when specific information necessary. Comments:	prematurely ending discussion. Asks confusing or	3
4. Questioning-summary clarification: Summarizes interview content periodically. Asks questions to clarify meaning, and to obtain a fuller understanding of the history. Comments:	patient. Does not summarize; or uses summary	4
5. Questioning skills, control: Interviewer is able to let the interview progress spontaneously to obtain the whole story, but redirects it when it becomes irrelevant or fragmented. Uses appropriate reinforcing cues (i.e., eye contact, leaning forward, nodding, smiling, repeating key words and phrases, etc.) or restricting cues (i.e., stops reinforcing cues, directs statements, etc.)	of the interviewer's control. Does not use restricting or reinforcing cues; or uses them inappropriately.

CONDUCT OF THE PHYSICAL EXAMINATION

The form for evaluating the conduct of a physical examination includes nine groups of features to be examined by the student and three other factors relevant to the assessment. The groups of features are listed in the first column and include: general appearance; head and neck; thorax and lungs; heart; abdomen; extremities; rectum; genitalia; and mental status. The lettered areas listed under each of the nine groups of features are to be checked (\checkmark) as the student examines them. The last three columns list the following factors: (1) student-patient relationship, e.g., adequacy of communication and the rapport the student establishes and maintains with the patient; consideration for the patient's physical and psychological comfort; explanation of the procedures of the examination; concern for the patient's modesty and dignity; (2) techniques or modes of examination, e.g., adequacy of inspection, palpation, percussion, and ausculation; appropriateness of the posture or position in which the student places himself and the patient as the examinations of the various regions are conducted (patient sitting up or lying on back, student standing at the foot or at the side of the bed); (3) use of diagnostic instruments, e.g., flashlight, tongue blade, ophthalmoscope, otoscope, stethoscope, reflex hammer, sphygmomanometer. For each of the nine groups of features the student examined, please indicate the extent to which the student demonstrated proficiency in the items listed under each of the three factors. Do this in the following manner:

 For each of the nine groups of features: check (V) each of the lettered areas that the student examined.

For each item listed under each of the three factors:
 write (+) if the student demonstrated satisfactory performance,
 write (-) if the student demonstrated unsatisfactory performance,
 write (O) if the item listed was not demonstrated by the student,
 write (NA) if the item listed was not applicable to the situation.

3. For each item in which the student demonstrated *unsatisfactory* performance, please explain the nature of the difficulty or problem in the space provided at the end of the form.

- I. Check-list: Physical examination (physician's assistant)
- II. Competences to be assessed:

Data-gathering
Physical examination

- III. Specific abilities to be assessed:
 - 1. Ability to conduct examination expertly and properly.
 - 2. Ability to employ common medical instruments effectively.
- IV. Purpose of assessment: summative.

Used as final examination at end of course for physician's assistants. Currently in use to assess extent of knowledge of a physical examination.

V. Comments:

Instrument has not been evaluated and no data are available regarding its validity. Student does not have the instrument as a reference; rater checks off the tasks the student elects to include. Those not done are left blank. A qualitative assessment is elicited as the second part of the instrument.

 - -suctioning
 - —change of tube

- III. Specific abilities to be assesed:
 - 1. Ability to perform specified nursing care techniques and procedures.
 - 2. Ability to adapt procedures to individual patient tolerance and condition.
 - 3. Ability to carry out procedures deftly, with a minimum of discomfort or embarrassment on the part of the patient.
- IV. Purpose of assessment: Summative.

Used to assess performance in each of the tested areas of patient care. Each separate test result is made available at the time, and a composite score forms the clinical achievement component of the requirements of registration as a trained nurse.

V. Comments:

Reliability and validity studies have been made, and statistical data are available.

VI. Source to contact for further information:

CLINICAL SKILLS ASSESSMENT TOOLS Advice to student and observer

The observer must ensure that, in addition to the activities on the test form, the student also performs the following activities for each test:

Activities common to all tests:

- A. Washes hands both before and after the procedure.
- B. Organizes requirements and equipment before commencing the test.
- C. Cleans away the equipment following the procedure.
- D. Reports and records observations and activities.

Protection of the patient and the student:

The assessment must cease if, in the judgment of the observer:

- 1. The patient is under any threat of physical, emotional, or environmental danger.
- 2. The student is an unprepared candidate, i.e.,
 - (a) has not performed common activities A and/or B
 - (b) shows evidence of insufficient prior learning, or
 - (c) shows extreme nervousness.

Activities:

¹N/A = not applicable

- I. Check-list and rating scale: Cardiovascular examination (physician)
- II. Competences to be assessed:

Data-gathering Recording

Interpreting

- III. Specific abilities to be assessed:
 - 1. Ability to perform 76 actions involved in a cardiovascular examination.
 - 2. Ability to interpret the data gathered during the examination.
 - 3. Ability to conduct the examination in a thorough and professional manner.
- IV. Purpose of assessment: summative.

To assess ability of medical student to carry out a cardiovascular examination and correctly interpret the signs and sounds that are observed.

V. Comments:

No evaluation has been done and no statistics are available regarding validity. Evaluator is asked to check performance for completeness and to rate the student's overall interpersonal skills.

CARDIOVASCULAR EXAMINATION PERFORMANCE CHECK-LIST

Examiner's name

	Patient's name
	Date
A. General inspection vital signs	
1. Wash hands before starting examination.	
2. Measure blood pressure in right upper limb	, sitting or lying.
3. Measure blood pressure in left upper limb.	sitting or lying
4. Measure blood pressure in either upper limb	o, standing.
5. Empty cuff completely before inflating it.	
6. Measure respiratory rate for at least 60 seco	nds.
7. Palpate radial pulse for at least 15 seconds.	
8. Palpate radial pulse simultaneously for symmetric sym	netry.
B. Hands and arms	
1. Inspect both hands.	
C. Head and neck	
1. Palpate carotids bilaterally.	
2. Auscultate carotids bilaterally.	
D. Lungs	
1. Ask patient to cross arms to move scapulae	and expose lung fields.
2. Percuss posterior lung fields.	
3. Percuss fields bilaterally and symmetrically,	n all areas.
4. Instruct patient to breathe through open mo5. Auscultate posterior lung fields.	uth.
6. Auscultate all areas hilaterally and	
6. Auscultate all areas bilaterally and symmetric Lateral lung fields	cally with patient breathing through open mouth.
7. Percuss lateral lung fields.	
8. Auscultate lateral lung fields.	
Anterior lung fields	
9. Percuss anterior lung fields.	
10. Percuss fields bilaterally and symmetrically.	
11. Auscultate anterior lung fields.	
12. Auscultate anterior lung fields bilaterally and	symmetrically
E. Heart	
1. Observe precordium.	
Palpate with patient sitting:	
2. Aortic area (2nd ICS-right)	
3. Pulmonic area (2nd and 3rd ICS-left).	4
4. Right ventricular area.	
5. Apical area (5th ICS-left).	
Auscultate with patient sitting (using diaphragm of stell	thoscope):
6. Aortic area	
7. Pulmonic area	
B. Tricuspid area (4th and 5th ICS at left sterna	l edge)
9. Mitral (apical) area.	
Auscultate with patient sitting (using bell of stethoscop	be):
10. Aortic area	
11. Pulmonic area	
12. Tricuspid area 13. Apical area.	
14. Observe neck veins with patient in recumber.	A
Palpate with patient recumbent:	r position.
15. Aortic area (2nd ICS-right)	
16. Pulmonic area (2nd and 3rd ICS-left)	
17. Right ventricular area.	•
18. Apical area (5th ICS-left)	
19. Ectopic area (between right ventricular and a	oical areas)
Auscultate with patient recumbent (using diaphragm of	stethoscope):
20. Aortic area	
21. Pulmonic area	
22. Tricuspid area	
23. Mitral (apical) area.	
Auscultate with patient recumbent (using bell of stethos	cope):
24. Aortic area	
25. Pulmonic area	
26. Tricuspid area	
27. Mitral (apical) area	
28. Ask patient to roll to left lateral position.	

Heart (conto	1.)					
29.	Relocate apex.					
	Auscultate apex with bell.					
	Auscultate apex with diaphragm.					
F. Abdomer						
	Patient is taught to relax abdominal musculature.					
	Watch patient's face as you examine abdomen.					
	Auscultate before manipulation or palpation.					
Auscultat						
4.	Aorta					
5.	Renal arteries					
6.	Iliac arteries.					
7.	Palpate epigastrium superficially.					
8.	Palpate epigastrium deeply.					
	Palpate right upper quadrant.					
10.	Use proper technique to palpate liver edge.					
11.	Percuss liver span.					
	Palpate left upper quadrant.					
13.	Use proper technique to palpate tip of spleen.					
G. Lower lin	mbs					
1.	Inspect bilaterally with outer clothes removed.					
2.	Inspect feet including toes.					
	oulses bilaterally:					
3.						
4.						
	Posterior tibial					
	Dorsalis pedis.					
	Auscultate for femoral bruits.					
	Check for peripheral pitting edema.					
9.	Use proper technique to check for pitting edema.

PERFORMANCE OF ANESTHETIC PROCEDURES

Student's name	

GUIDELINES FOR RATING

Outstanding (4 points). Exceeds required objectives, performs steps carefully and skillfully in minimal time.

is able to evaluate performance and identify ways for improvement.

Above average (3 points): Exceeds required objectives, performs steps carefully and skillfully. Is able to evaluate

performance and identify *most* of the ways for improvement. *Makes minor errors*. Meets required objectives, demonstrates the minimally acceptable performance. Is able

to identify some ways for improvement. Makes major errors.

Unsatisfactory (1 point): Fails to meet most of the required objectives. Makes critical errors.

- 1. Statements are same for all five scales.
- 2. All scales have equal weight.

Average (2 points):

3. Final grades are determined from students' rating performances in all hospitals and from general observations which cannot be written into specific objectives.

Development of an anesthetic care plan	Points	Evaluation comments
 Provides patient with a simple and reassuring explanation of visit during the pre-anesthetic assessment. Selects anesthetic care plan to meet the patient's physical and psychological needs as well as surgical requirements. Evaluates laboratory data and correctness of consent prior to developing an appropriate management plan. Analyses specific drug therapy and correlates the ASA¹ status with the pathophysiology when structuring an anesthetic plan. Determines the need for selected equipment to accommodate surgical requirement. Anticipates the need to make adjustments in the application and securing of monitoring equipment used. Chooses a cannula of appropriate size for venipuncture insertion and determines volume replacement for the individual patients and procedures. Plans induction and management based on the patient's needs, and on the type and length of the surgical procedure. 		
Total		
Correlation of didactic with clinical aspects	Points	Evaluation comments

Correlation of didactic with clinical aspects	Points	Evaluation comments
 Correlates knowledge of pathophysiology and comprehension of anesthetic risk when assigning ASA¹ status and in making premedication recommendations. Integrates knowledge of various inhalation and intravenous anesthetics used. Determines a suitable technique for the selected case. Compares and contrasts the pharmacological effects of all relaxants used and gives reasons for specific selection. Explains mechanisms of physiological effects following positional changes and correlates knowledge to protect patient effectively. Determines the specific type of induction indicated for a given case, i.e., awake, slow, rapid, crash. Demonstrates an understanding of the principles of fluid balance and blood replacement in the patient. Distinguishes between routine oral and nasal intubation and alters technique for specific airway management problems, i.e., oral versus nasal, tube size, etc. Gives examples where preoxygenation is of critical importance in anesthetic management. 		
Cumulative total		

¹ American Society of Anesthesiologists.

Implementation of anesthetic process	Points	Evaluation comments
Assembles and checks routine and specialized equipment.		
2. Uses aseptic techniques to prepare and administer all		
intravenous drugs.		
Individualizes anesthetic requirement and proceeds with appropriate induction and maintenance.		
4. Assesses the need for additional laboratory data and obtains		
them prior to induction.		
5. Demonstrates ability to chart with completeness and		
accuracy. 6. Uses judgement in applying and securing monitors, in-		
travenous equipment, and face mask.		
7. Positions patients, using physiological principles, and anti-		
cipates problems related to postural changes.		
8. Inserts oral and nasal pharyngeal airway skillfully and		
demonstrates ability to recognize and correct airway problems.		
Maintains an uncomplicated airway, coordinates venti-		
lation, and monitors vital signs during anesthetic		
management.		
0. Demonstrates dexterity in performing oral and nasal in-		
tubation and extubation.		
 Uses appropriate measures to assess adequate ventilation prior to extubation. 		
12. Administers estimated fluid requirement and assesses need		
for blood replacement.		
3. Demonstrates ability to perform a <i>rapid induction</i> correctly.		
4. Inserts esophageal stethoscope, nasogastric tube, and tem-		
perature probe skillfully and is conscious of possible complications.		
15. Recognizes and attempts to make appropriate corrections of		
mechanical and physiological problems.		
6. Identifies ECG abnormalities; attempts to determine cause		
and basic anesthetic adjustments.		
 Monitors vital signs, assesses the need for postoperative ventilatory support, and relays pertinent information to 		
appropriate postanesthetic recovery staff.		
Cumulative total		
nterpersonal behavior	Points	Evaluation comments
Demonstrates flexibility regarding change in room or patient		
assignment.		
Continuously evaluates self and recognizes capabilities and limitations.		
B. Cooperative and willing to help fellow students when		
needed.		
1. Assists with management of patients in postanesthetic		
recovery (arterial blood gases, extubation, monitoring, venti-		
latory care).		
Demonstrates initiative in formulating anesthetic process with underclassmen.		
6. Maintains effective interaction with patients, peers, and all		
instructional staff, including affiliated staff.		
. Shows a positive and receptive interest in all learning		
activities provided.		
 Demonstrates ability to respond appropriately to stressful situations. 		
Cumulative total		
Care of anesthetic equipment	Points	Evaluation comments
. Cleans and restocks all routine and specialized equipment		
used		
Turns off routine and specialized equipment, including gas		
supply, at end of each case.		
Restocks drug and supply carts in emergency rooms, includ-		
Restocks drug and supply carts in emergency rooms, including the cardiac arrest cart.		
Restocks drug and supply carts in emergency rooms, including the cardiac arrest cart. Removes all unnecessary equipment from room after each case and reports faulty equipment.

PHYSICAL EXAMINATION OF THE HEART

Yes No Instructed the patient about procedure. Exposed chest to reveal landmarks. 3. Placed the patient in sitting position and performed the following: 4. Inspection (a) Any abnormal pulsations? (b) Is point of maximum intensity visible, localized, or diffuse, location by interspace and distance from left sternal border or mid-clavicular line? 5. Palpation (a) Placed hand over 2nd interspace to right of the sternum (b) Placed hand over 2nd interspace to the left of sternum. (c) Placed hand over the apical area. (d) Palpated the apex beat, noted intensity, measured the location of the apex beat by interspace and distance from the left border of the sternum or from mid-clavicular line. 6. Auscultation (a) Were heart rate and regularity determined over the apex and checked with radial pulse? (b) Was auscultation with bell and diaphragm performed in the following areas? (1) The apical area, left lateral position. (2) 2nd right interspace and Erb's point. (3) 2nd left interspace. (4) Area just above the xiphoid. (5) When Erb's point was auscultated, was patient requested to lean forward and exhale deeply? (c) Ask student to describe abnormalities. (d) Was abnormality validated by supervising examiner? **EXAMINATION OF THE LUNGS** Yes No 1. Instructed patient about procedure 2. Exposed the chest to reveal landmarks. 3. Placed the patient in a sitting position and performed the following. (a) Counted respiratory rate per minute. (b) Noted amplitude of breathing: shallow, deep, normal. (c) Noted respiratory rhythm: regular, irregular, periodic. (d) Noted chest deformities, symmetry, the use of accessory muscles of respiration (e) Noted degree of chest expansion using measuring tape. 5. Palpation (a) Noted degree of chest expansion bilaterally by placing hands on lower thoracic cage, both anterior and posterior, having patient inhale and exhale deeply. (b) Elicited tactile fremitus. 6. Percussion (a) Anterior lung fields, upper, bilaterally, (b) Lateral lung fields. (c) Posterior lung fields, upper, middle, and lower. 7. Auscultation (a) Anterior upper lung fields for vocal fremitus. (b) Lateral lung fields, asking patient to breathe more deeply and rapidly with mouth open. (c) Posterior lung fields, upper, mid, and lower, asking the patient to breathe more deeply and rapidly with mouth open. (d) Is each area auscultated for intensity and duration of inspiration and expiration and the presence or absence of adventitious sounds, with the patient inhaling and exhaling deeply through his mouth? (e) Is the patient requested to cough after a deep expiration as a part of auscultation? (f) Are pectoriloguy and vocal fremitus performed?

PHYSICAL EXAMINATION OF THE ABDOMEN

Y	25	N	0

- 1. Instructed the patient about procedure.
- 2. Exposed the abdomen to the extent that the four quadrants were revealed
- 3. Placed patient in supine position.
- 4. Placed patient's arms to his side or on his chest.
- 5. Inspection
 - (a) Was abdomen carefully inspected for type, presence of distention, dermatitis, abnormal pulsations or masses, scars, venous engorgement, protusion in flanks?
- 6. Auscultation
 - (a) Was auscultation performed over the four quadrants of the abdomen and the renal areas posterior?
- 7. Percussion
 - (a) Was percussion performed over the four quadrants of the abdomen and any abnormality described by location, size, shape?
 - (b) Demonstrated the tests for shifting dullness in the supine position.
 - (c) Demonstrated the tests for shifting dullness in the lateral position.
 - (d) Have student demonstrate how the succussion splash is elicited
- 8. Palpation
 - (a) Was patient requested to report tenderness or pain when palpating?
 - (b) Was palpation performed in the four quadrants initially superficially and then deeply for tenderness, pain, rigidity, guarding, masses, hernia, and adequately described? Location, size, and shape, consistency, texture (smooth or modular), movable or nonmovable, pulsatile.
- 9. Liver
 - (a) Percussed upper liver border.
 - (b) Palpated by placing left hand under the patient
 - (c) Asked patient to take deep breath while palpating lower edge by moving from right lower quadrant to right upper quadrant.
 - (d) Was lower edge of liver palpated in the medial line?
 - (e) If liver edge palpable, measured span between upper and lower borders and from lower costal margin to liver edge.
- 10. Spleen
 - (a) When palpating placed one hand under patient. Asked patient to take deep breath while palpating, moving from left lower quadrant to left upper quadrant.
 - (b) Patient rolled to the right at approximately 30 degrees and lower edge of spleen palpated
 - (c) Lower edge of spleen palpated with thighs flexed at approximately 45 degrees.
- 11. Kidneys
 - (a) Lower edge of kidneys palpated bilaterally
- 13. Did the student find any abnormalities?
- 14. Was the student standing on right side of patient?
- 15. Were these abnormalities verified by the supervising examiner?

- I. Rating scale: Specific nursing activities
- II. Competences to be assessed:

Clinical skills

- hanging and monitoring an intravenous drip (IV)
- administering "piggyback" medications
- change of dressing
- application of elastic bandages
- protective isolation
- isolation
- urinary bladder catheterization
- tracheal suctioning

Communication

- III. Specific abilities to be assessed:
 - 1. Abilities required to perform the nursing care techniques listed above.
- IV. Purpose of assessment: summative.

Used periodically as each technique is learned, and/or as final examination at end of nursing course.

V. Comments:

Instrument has not been evaluated. Each part affords step by step analysis of the relevant technique.

EVALUATION FORMS FOR SPECIFIC TECHNIQUES

Hanging and monitoring an intravenous drip (IV)

Points

Points

Date_

The student will perform the following steps in preparing and hanging an IV.

Benavior	possible	earned
1. Chooses correct solution from stock supply as determined directly from	om	
physician's order.	10	
2. Calculates correct drip rate to implement physician's order.	15	
3. Checks bottle/solution for cracks, impurities, and expiration date.	10	
4. Labels bottle with:		
(a) client's name		
(b) date and time started	5	
(c) sequence of bottle	5	
(d) student's name and initials	5	
(e) number of cc/h	5	
(f) number of gtt/min.	5	
5. Identifies client by comparing ID band with bottle label.	10	
6. Hangs new bottle by connecting into existing tubing set-up, maintaini	ing	
surgical asepsis.	15	
7. Using the regulator clamp below the drip chamber, adjusts drip rate to within	n 3	
gtt/min. of calculated rate.	10	
TOTAL	100

Change of dressing

The student will perform the following steps in demonstrating change of dressing.

	Behavior	Points possible	Points earned
1. Pro	eparation		
(a)	Explains procedure to client.	5	
(b)	Checks appearance of present dressing.	5	
(c)	Washes hands.	5	
(0)	Obtains necessary equipment.	5	
	1. 4 × 4's		
	2. abdominal (ABD) pad		
	3. tape		
	4. waterproof bag		
	5. sterile gloves		
	6. non-sterile glove		
	Prepares lengths of tape.	2	
(f)	Arranges equipment.	3	
	Opens sterile packages.	5	
(h)	Positions client and provides for privacy.	5	
	moves soiled dressings		
(a)	Removes tape from old dressing, stabilizing skin.	5	
(b)	Removes soiled dressings. Wears non-sterile glove or uses forceps.	5	
(c)	Discards soiled dressings in waterproof bag.	5	
	plies sterile dressing, maintaining surgical asepsis:		
	Dons sterile gloves.	10	
(b)	Uses 4 × 4's to dry skin around wound as necessary.	10	
	Fluffs 4 × 4 and applies to wound.	10	
	Applies ABD pad.	5	
	Places tape parallel to major body folds.	10	
	cords observations (states what would be recorded)	5	
	degree of healing		
(b)	presence and amount of inflammation and/or necrotic tissue.		
	color and odor of drainage.		
(d)	condition of sutures and drains, if present.

Application of elastic bandages

The student will perform the following steps in demonstrating the application of elastic bandages to a leg.

	Behavior	Points possible	Points earned
1.	Prior to application, assesses circulatory status of extremity (states how nurse		
	would do this).	10	
	Applies bandage from distal to proximal.	10	
3.	Makes one circular wrap around foot to secure bandage.	10	
4.	Brings second wrap around ankle and back to foot in "figure 8" wrap.	10	
	Third wrap is made from foot to ankle and back, covering heel.	10	
	Continues with "figure 8" wrap to thigh.	10	
7.	Maintains consistent moderate pressure while wrapping.	10	
	Checks back of knee to avoid excessive pressure.	10	
	Places fingers under wrap while applying clips.	5	
	Secures bandage by placing tape strip on entire length of bandage.	5	
	Checks circulatory status of foot after application of bandage.	10	
	TOTAL	100

Protective isolation

	Behavior	Points possible	Points earned
٨.	Entering a protective isolation area		
	After washing hands, turns off faucet handles with dry paper towel. Applies necessary garments	10	
	(a) Applies hair-covering so all hair is secured/covered.	10	
	(b) Applies mask so nose and mouth are covered.	10	
	(c) Re-washes hands; turns off faucet with dry paper towel.	10	
	(d) Applies gown so that "client contact" areas remain uncontaminated		
	(partner secures ties).	10	
	(e) Applies gloves, using aseptic technique.	10	
	(f) Applies gloves so that the gown cuffs are covered by the glove cuffs.	10	
	3. Explains method of entering room without contamination of self.	10	
	Admitting an article to the protective isolation area (partner outside room stands at door with article partially unwrapped)		
	1. Directs the transfer of an article in such a way that neither the article nor the		
	"inside" nurse's apparel are contaminated.	10	
	Leaving a protective isolation area		
	1. On leaving, removes garments and discards in receptacle outside protective		
	isolation room.	10	
	TOTAL	100

Isolation ("bagging-out" and leaving room)

The student will perform the following steps in demonstrating isolation technique.

Behavior	Points possible	Points earned
. "Bagging-out"		
(a) Seals the bag of contaminated linen.	5	
(b) Places the sealed bag upside down in the clean bag (being held by a	3	
colleague).	5	
(c) Does not touch the outside of the clean bag or the colleague with	3	
contaminated gloves or gown.	/ 10	
Leaving the room	, ,	
(a) With gloves on, unties the waist strings of the gown.	5	
(b) Removes and discards gloves.	5	
(c) Washes hands.	10	
(d) Unties neck strings of gown.	5	
(e) Removes gown, keeping clean side of gown toward self.	5	
(f) Grasps gown on the inside and turns contaminated surfaces together.	5	
(g) Holds gown away from uniform and folds it from neck down.	5	
(h) Does not allow contaminated surfaces of gown to come in contact with		
uniform. Discards gown. (i) Washes hands and forearms.	10	
	` 5	
(i) Turns off faucet with paper towel. Discards.	5	
(k) Removes mask by strings on elastic and deposits in trash.(/) Opens door by using clean paper towel.	5	
(m) Discards paper towel in waste receptacle inside unit.	5	
(m) Discards paper tower in waste receptacle inside unit.	10

Tracheal suctioning

The student will perform the following steps in tracheal suctioning.

	Behavior	Points possible	Points earned
1.	Washes hands.	3	
2.	Gathers equipment (saline, suction package, source of suction) and checks		
	suction setting.	2	
3.	Explains procedure to client.	5	
4.	Prepares suction package, opens using sterile technique.	5	
5.	Puts normal saline in cup properly.	5	
6.	Puts sterile glove on dominant hand.	5	
7.	Attaches sterile catheter to suction.	5	
8.	Lubricates catheter with normal saline.	5	
9.	Tells client that placement of catheter will occur.	5	
10.	Gently and quickly puts catheter down as far as can go.	5	
11.	Suction is not applied while catheter is being inserted.	10	
12.	Pulls catheter back 1–2 cm.	5	
13.	Applies intermittent suction while removing catheter.	10	
	Rotates or twirls catheter while removing catheter.	10	
15.	Catheter withdrawal done in 5-10 seconds.	10	
16.	States that he/she will allow client to rest before repeating procedure.	3	
	Assesses client after suctioning (states each step of assessment).	5	
	(a) general color		
	(b) color of nailbeds		
	(c) lung sounds		
	(d) reaction of client (anxiety, combativeness, etc.).		
18.	Records observations (states that would be recorded).	2	
	(a) assessment data		
	(b) color of secretions		
	(c) type or consistency of secretions		
	(d) amount of secretions

RADIATION ONCOLOGY CLINICAL EVALUATION

Rotation I

(Weeks 1-17)

Student

Location		
 Does the student handle the patients and ensure their comfort appropriately? Can the student set the field size correctly? Can the student set the gantry angle correctly? Can the student set the treatment distance correctly? Can the student set the treatment table correctly? Is the student aware of, and able to implement, all radiation safety procedures? Does the student understand the purpose and importance of skin markings? Can the student correctly operate the control panel under supervision? Is the student starting to recognize common behavioral patterns in the cancer patients? Does the student maintain cleanliness and order in the treatment room? Can the student correctly identify body planes and anatomical terms necessary for the treatment set-up? Can the student correctly interpret the set-up instructions? 	Yes	No
 13. Can the student operate the assigned equipment under supervision? 14. Is the student starting to perform darkroom procedures? 15. Can the student assist in all filming techniques (localization, verification, and diagnostic)? 16. Can the student use his knowledge of body planes, anatomical terms, etc. to prepare patients for examination? Supervisory comments: 		
Student's comments:

PATIENT EDUCATION

OBSERVATION SHEET

Protocol topic Observer's name					
Performance feedback Did the student:	++	+	rande	Not observed	Comments or examples
 (a) Establish rapport with patient? (b) Determine patient's level of interest and/or readiness for learning about topic? (c) Find out what patient already knows, using open-ended, focused questions? (d) Provide new information in manner that seemed to be understood by patient? e.g., 1. clarity of language (jargon?) 2. systematic (logical) sequence of ideas and concepts 3. use of pertinent examples, analogies, or applications 4. appropriate depth for patient's intellectual/emotional level 5. recognize patient's saturation point (know when to stop). (e) Determine whether patient understood information, using effective ("nonregurgitative") questioning? (f) Use visual aids appropriately? (g) Give patient a handout or reinforce information in some other way? (h) Offer a method of follow-up for problems or confusion at home (e.g., "please call me")? PROTOCOL FEEDBACK: How well does 					

written protocol convey content and pro-

cess used?

- I. Check-list: Dental hygiene procedures (dental hygienist)
- II. Competences to be assessed:

Data-gathering

Recording

Patient management

Patient education

Scaling of teeth

- III. Specific types of ability to be assessed:
 - 1. Ability to elicit relevant medical-dental history.
 - 2. Ability to carry out extra- and intra-oral examinations and record resulting data accurately.
 - 3. Ability to instruct patient in techniques of brushing teeth and using floss.
 - 4. Ability to scale teeth effectively and efficiently.
 - 5. Ability to perform dental hygiene procedures in accordance with acceptable professional standards.
- IV. Purpose of assessment: summative.

Used periodically to assess ability in areas of the preliminary dental examination; patient education; and scaling techniques.

V. Comments:

No evaluation has been done.

Traditional birth attendants. Geneva, World Health Organization, 1979 (WHO Offset Publication, No. 44), pages 70-73.

Sample checklist to assess a TBA's performance during a delivery demonstration in the home

Name of TBA Observed by					
Location of TBA	Date of o	bservat	ion		
	,	Per	formance		Comment
		Plus*	Minus*	N.O.*	
A. Recognition of onset of labour	ation of				
 Inquires about the presence and dur backache or abdominal cramps 	ation of				
- pink discharge or "show"					
- uterine contractions					
- breaking of "bag of waters"					
2. Examines the abdomen to determine					
 position of baby duration of contractions 					
- severity of contractions					
B. Preparation for delivery	•				
 Selects site for the delivery that quiet, clean, ventilated 	15				
- uncluttered, with adequate space f	or				
arranging supplies					
2. Prepares equipment for the delivery					
- scrubs hands					
- removes contents of delivery kit - boils scissors 10 minutes					
- arranges items for easy reachabil	ity				
- covers supplies with clean cover					
ready for use during delivery					
- obtains container for waste - covers delivery site with clean m	atorial				
	ig cer re r				
3. Prepares herself for delivery					
- scrubs hands thoroughly prior to					
preparation of mother					
- performs additional hand-scrubbin	ig as				
necessary during delivery - puts on clean apron or the like w	hen				
delivery is near					
4. Prepares mother for delivery					
- checks if mother bathed early in	labour				
- helps mother to bathe if needed					
 cleanses vulva with safe cleansing agent and water 	ıg				
- uses downward strokes in cleansing	ıg				
- discards each swab after use					
- gives fluids throughout labour					

^{*&}quot;Plus" can mean either "yes" or "satisfactory". "Minus" can mean either "no" or "unsatisfactory". "N.O." means "not observed".

	Per	formance	Commen
C. Care to mother in labour	Plus*	Minus* N.O.	*
Provides appropriate care during labour provides backrub for comfort			
 helps mother to change position as necessary provides emotional support to mother 			
- relates to family members in culturally prescribed manner			
 avoids unnecessary interference with birth process such as strong massage of abdomen 			
 insertion of hands into birth canal administration of medications 			
1. Palpates abdomen to determine - baby's position			
- quality and duration of contractions			
2. Observes perineum for abnormal bleeding			
3. Recognizes danger signs during labour - prolonged labour - convulsions during labour			
- breech or shoulder presentation of baby - prolapsed cord			
4.Responds appropriately to complications of delivery - summons midwife or physician if possible			
- initiates appropriate care until help arrives			
Performance of safe, hygienic delivery 1. Prepares for delivery - puts on clean apron			
 thoroughly scrubs hands watches perineum for appearance of baby's head 			
2. Prevents perineal laceration - applies gentle pressure to baby's head to slow the delivery			
- instructs mother to pant so as to reduce speed of delivery of head			

- applies gentle manual support to

perineal area

	Performance		Comment	
	Plus*	Minus*	N.O.	
3. Delivers the baby - supports the head as it emerges - feels around baby's neck for cord - gently slips cord over head if it was found around neck - removes sac from head if it is present - wipes baby's eyes, nose, and mouth with clean swab as soon as head emerges - supports baby as its body emerges - inverts baby to drain mucus	Plus*	Minus*	N.O.•	
- places baby on clean cover between mother's legs				
4. Attends to umbilical cord - washes hands before manipulating cord - tests cord for cessation of pulsations - avoids contamination of cord ties - applies clean cord ties - ties square knots in applying cord ties - checks knots for security - lifts scissors by handles, avoiding contact with blades - cuts cord between the two cord ties - observes cord stump for bleeding - touches only edges of cord dressing - applies dressing, with cord in "turned up" position - avoids unsafe practices in cord care such as application of unclean materials, earth, saliva, ashes				
 5. Prevents haemorrhage puts baby to mother's breast to stimulate uterine contraction identifies separation of placenta by watching for small gush of blood from birth canal avoids pulling on placenta or membranes as placenta emerges catches placenta in basin inspects placenta carefully to see if it is complete examines placenta for evidence of foul odour inspects external genitals for fresh bleeding or lacerations palpates uterine fundus frequently for hardness massages uterus gently to control excessive blood loss avoids unsafe practices such as packing 				

birth canal to stop bleeding

F. After-care of mother

Promotes mother's comfort after delivery

- wipes perineum with clean swabs
- uses downward strokes in wiping perineum
- sponges mother
- changes mother's clothing
- provides clean mat to lie on
- applies clean pad to perineum
- offers food and drink
 - provides opportunity for rest

Per	formance	1	Comment
